AWS Certified SysOps Administrator Associate Course

SOA-C02

Welcome!

- We're going to prepare for the SysOps exam SOA-C02
- It's a challenging certification, this course will be long and interesting 😊

- How the course is structured:
  - If some base knowledge is needed: videos are imported from
    - Certified Cloud Practitioner, ex: *[CCP] EC2 Instances Launch Types*
    - Certified Solutions Architect Associate, ex: *[SAA] EC2 Hibernate Hands On*
    - Certified Developer Associate, ex: *[DVA] CloudFormation Drift*
  - SysOps-specific videos (not marked with […])

About me

- I'm Stephane!
- 11x AWS Certified
- Worked with AWS many years: built websites, apps, streaming platforms
- Veteran Instructor on AWS (Certifications, CloudFormation, Lambda, EC2…)

- You can find me on
  - LinkedIn: https://www.linkedin.com/in/stephanemaarek
  - Instagram: https://Instagram.com/stephanemaarek
  - Medium: https://medium.com/@stephane.maarek
  - Twitter: https://twitter.com/stephanemaarek
  - GitHub: https://github.com/simplesteph

Amazon EC2 for SysOps

Rocking EC2 from a SysOps perspective

EC2 Changing Instance Type

t2.micro → t2.small

- This only works for EBS backed instances
- Stop the instance
- Instance Settings => Change Instance Type
- Start Instance

Enhanced Networking

- EC2 Enhanced Networking (SR-IOV)
  - Higher bandwidth, higher PPS (packet per second), **lower latency**
  - Option 1: **Elastic Network Adapter (ENA)** up to 100 Gbps
  - Option 2: Intel 82599 VF up to 10 Gbps – LEGACY
  - Works for newer generation EC2 Instances

- Elastic Fabric Adapter (EFA)
  - Improved ENA for **HPC**, only works for **Linux**
  - Great for inter-node communications, **tightly coupled workloads**
  - Leverages Message Passing Interface (MPI) standard
  - Bypasses the underlying Linux OS to provide low-latency, reliable transport
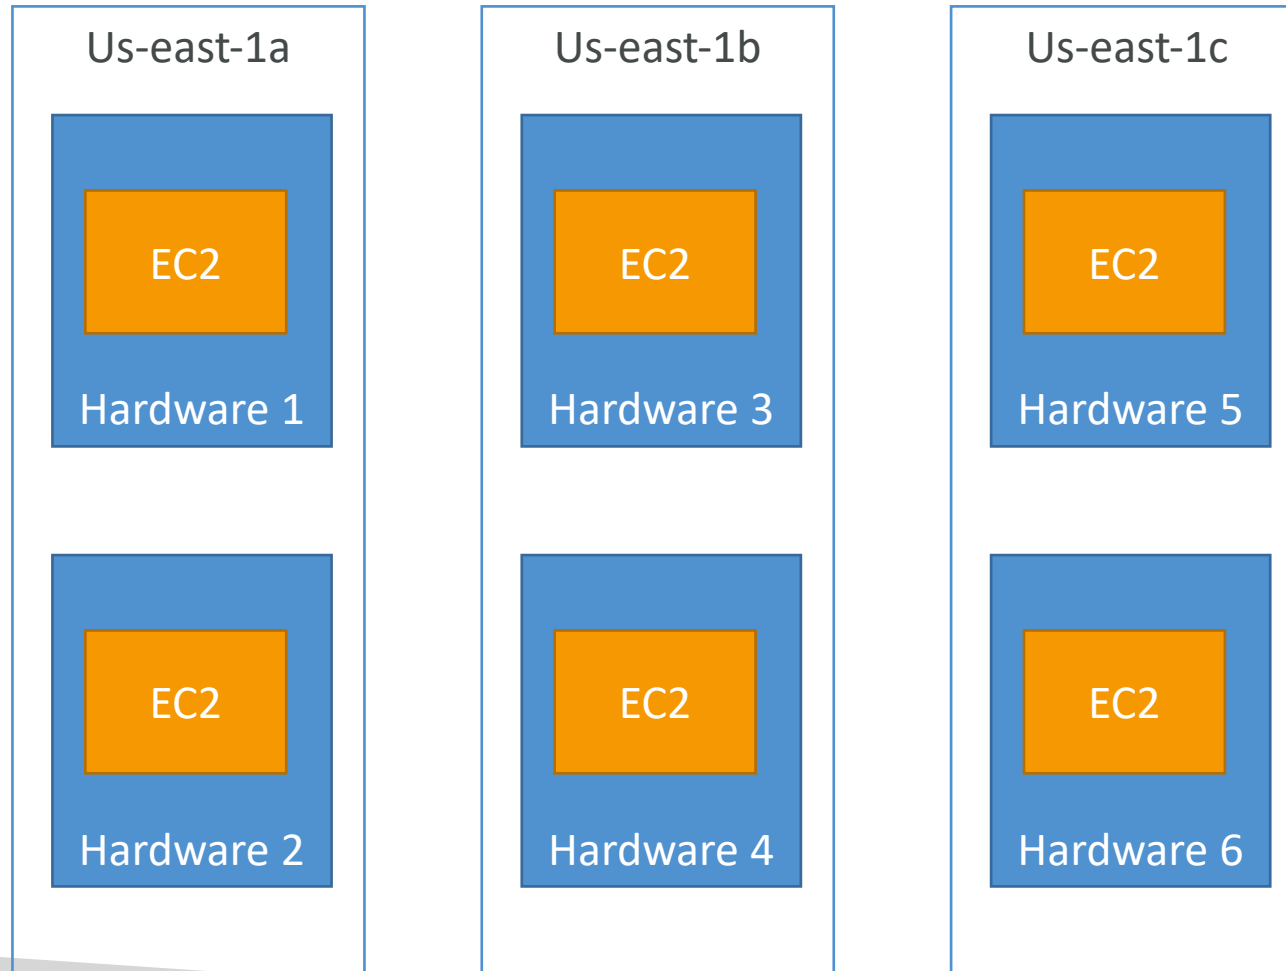

Placement Groups

- Sometimes you want control over the EC2 Instance placement strategy

- That strategy can be defined using placement groups

- When you create a placement group, you specify one of the following strategies for the group:

  - *Cluster*—clusters instances into a low-latency group in a single Availability Zone

  - *Spread*—spreads instances across underlying hardware (max 7 instances per group per AZ) – critical applications

  - *Partition*—spreads instances across many different partitions (which rely on different sets of racks) within an AZ. Scales to 100s of EC2 instances per group (Hadoop, Cassandra, Kafka)

Placement Groups Cluster

Same AZ

| EC2 | EC2 | EC2 |
| EC2 | EC2 | EC2 |

Placement group
Cluster
Low latency
10 Gbps network
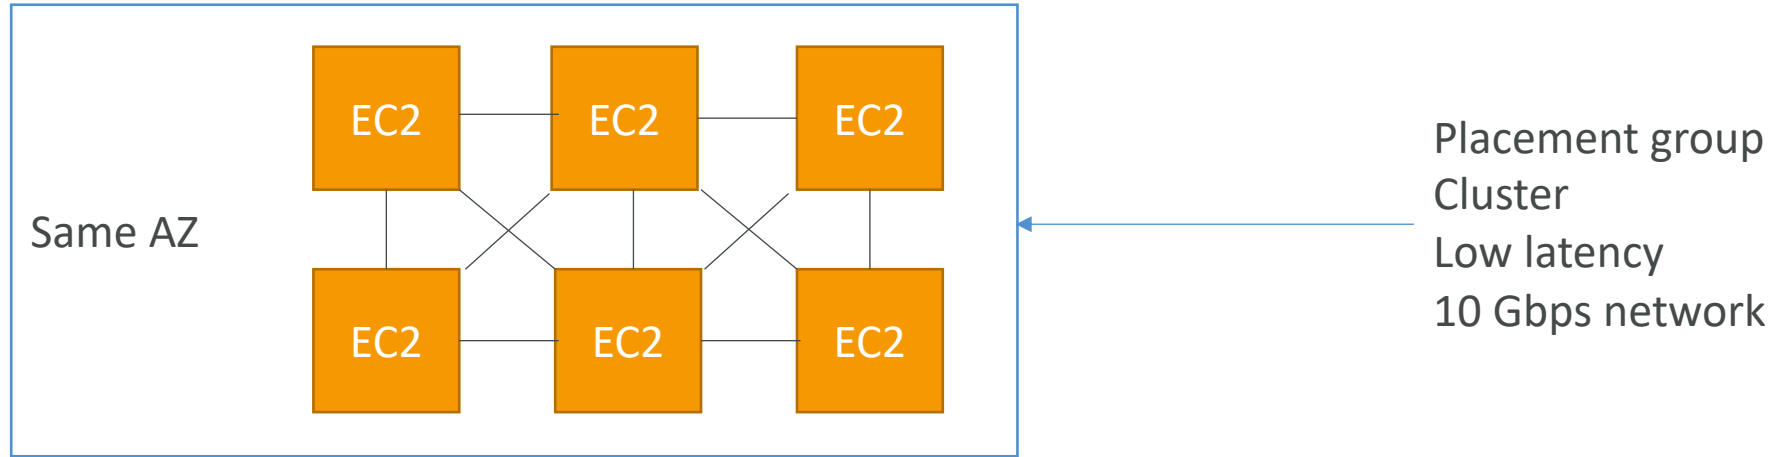

- Pros: Great network (10 Gbps bandwidth between instances with Enhanced Networking enabled - recommended)

- Cons: If the AZ fails, all instances fails at the same time

- Use case:
  - Big Data job that needs to complete fast
  - Application that needs extremely low latency and high network throughput

Placement Groups Spread

Us-east-1a	Us-east-1b	Us-east-1c
EC2 Hardware 1	EC2 Hardware 3	EC2 Hardware 5
EC2 Hardware 2	EC2 Hardware 4	EC2 Hardware 6

- Pros:
  - Can span across Availability Zones (AZ)
  - Reduced risk is simultaneous failure
  - EC2 Instances are on different physical hardware
- Cons:
  - Limited to 7 instances per AZ per placement group
- Use case:
  - Application that needs to maximize high availability
  - Critical Applications where each instance must be isolated from failure from each other

Placements Groups Partition

us-east-1a

Partition 1	Partition 2
EC2	EC2
EC2	EC2
EC2	EC2
EC2	EC2

us-east-1b

Partition 3
EC2
EC2
EC2
EC2

- Up to 7 partitions per AZ
- Can span across multiple AZs in the same region
- Up to 100s of EC2 instances
- The instances in a partition do not share racks with the instances in the other partitions
- A partition failure can affect many EC2 but won't affect other partitions
- EC2 instances get access to the partition information as metadata
- Use cases: HDFS, HBase, Cassandra, Kafka

Shutdown Behavior

- **Shutdown Behavior**: How should the instance react when shutdown is done using the OS?
  - **Stop** (default)
  - **Terminate**

- This is not applicable when shutting down from AWS console.

- CLI Attribute: InstanceInitiatedShutdownBehavior

www.datacumulus.com

OS shutdown

$ shutdown

EC2 Instance (running)

Shutdown Behavior

Stop

Terminate

EC2 Instance (stopped)
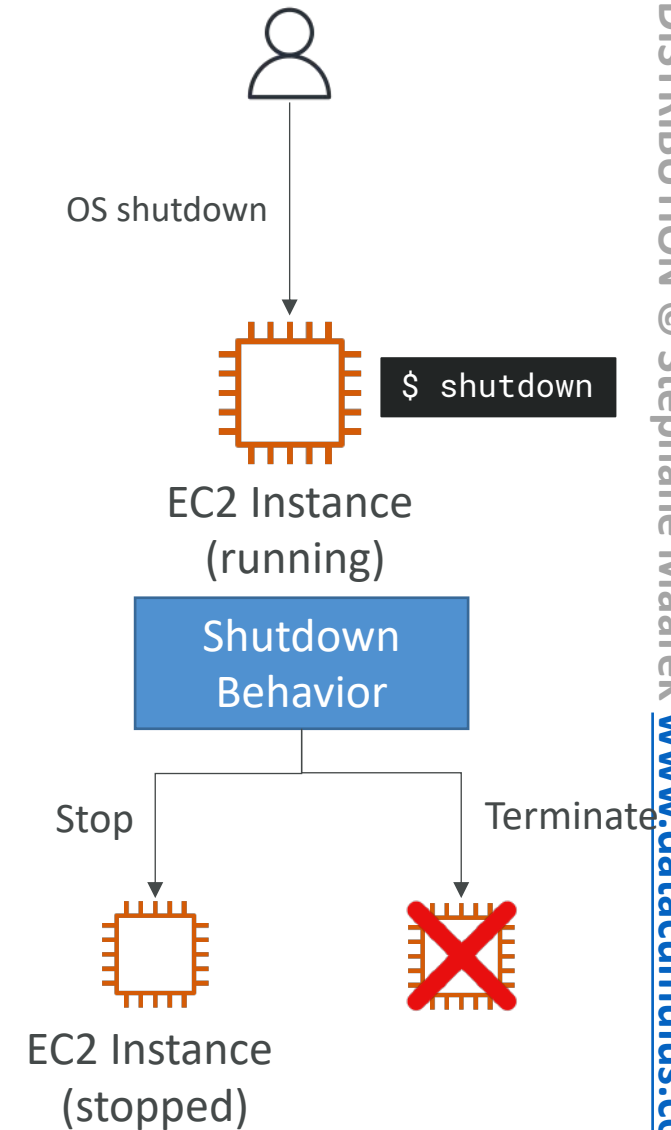

Termination Protection

- **Enable termination protection**:
  To protect against accidental termination in AWS Console or CLI

- Exam Tip:
  - We have an instance where shutdown behavior = terminate and enable terminate protection is ticked
  - We shutdown the instance from the OS, what will happen ?

  - The instance will still be terminated!

EC2 Launch Troubleshooting

- **# InstanceLimitExceeded:** if you get this error, it means that you have reached your limit of max number of **vCPUs** per region

- On-Demand instance limits are set on a per-region basis

- Example: If you run on-demand (A, C, D, H, I, M, R, T, Z) instance types you'll have 64 vCPUs (default)

- Resolution: Either launch the instance in a different region or request AWS to increase your limit of the region

- NOTE: vCPU-based limits only apply to running On-Demand instances and Spot instances

EC2 Launch Troubleshooting

- **# InsufficientInstanceCapacity** : if you get this error, it means AWS does not have that enough On-Demand capacity in the particular AZ where the instance is launched.

- Resolution :
  - Wait for few mins before requesting again.
  - If requesting more than 1 requests, break down the requests. If you need 5 instances, rather than a single request of 5, request one by one.
  - If urgent, **submit a request for a different instance type now**, which can be resized later.
  - Also, can request the EC2 instance in a different AZ

EC2 Launch Troubleshooting

- **# Instance Terminates Immediately** (goes from pending to terminated)
  - You've reached your EBS volume limit.
  - An EBS snapshot is corrupt.
  - The root EBS volume is encrypted and you do not have permissions to access the KMS key for decryption.
  - The instance store-backed AMI that you used to launch the instance is missing a required part (an image.part.*xx* file).

- **To find the exact reason**, check out the EC2 console of AWS - instances - Description tab, note the reason next to the State transition reason label.

EC2 SSH troubleshooting

- Make sure the private key (pem file) on your linux machine has 400 permissions, else you will get **"Unprotected private key file"** error

- Make sure the username for the OS is given correctly when logging via SSH, else you will get **"Host key not found"**, **"Permission denied"**, or **"Connection closed by [instance] port 22"** error

- Possible reasons for **"Connection timed out"** to EC2 instance via SSH:
  - SG is not configured correctly
  - NACL is not configured correctly
  - Check the route table for the subnet (routes traffic destined outside VPC to IGW)
  - Instance doesn't have a public IPv4
  - CPU load of the instance is high
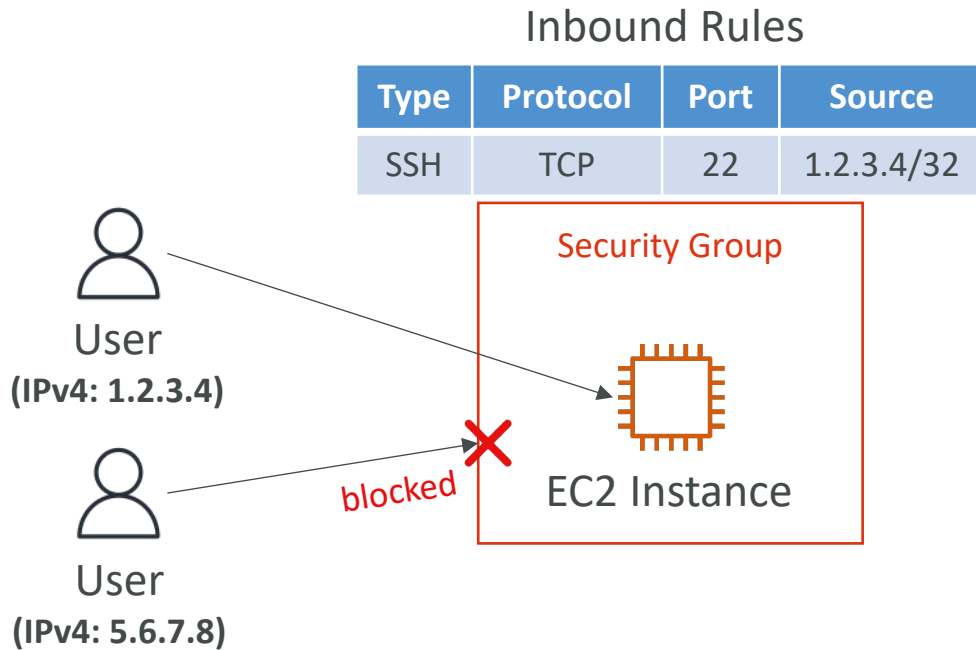

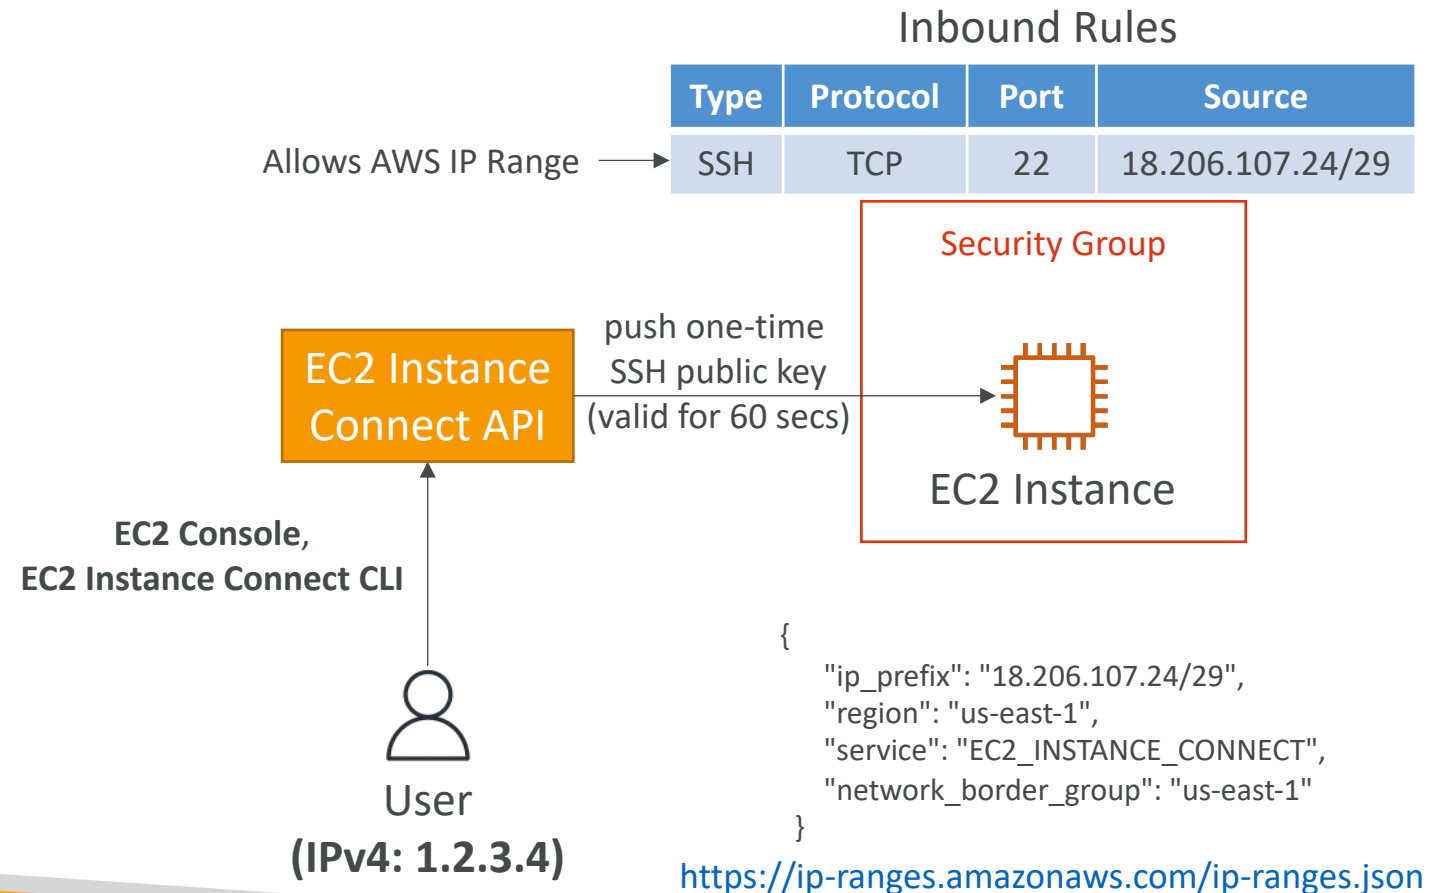

EC2 Instances Purchasing Options

- **On-Demand Instances** – short workload, predictable pricing, pay by second

- **Reserved** (1 & 3 years)
  - **Reserved Instances** – long workloads
  - **Convertible Reserved Instances** – long workloads with flexible instances

- **Savings Plans** (1 & 3 years) –commitment to an amount of usage, long workload

- **Spot Instances** – short workloads, cheap, can lose instances (less reliable)

- **Dedicated Hosts** – book an entire physical server, control instance placement

- **Dedicated Instances** – no other customers will share your hardware

- **Capacity Reservations** – reserve capacity in a specific AZ for any duration

EC2 On Demand

- Pay for what you use:
  - Linux or Windows - billing per second, after the first minute
  - All other operating systems - billing per hour

- Has the highest cost but no upfront payment

- No long-term commitment

- Recommended for **short-term** and **un-interrupted workloads**, where you can't predict how the application will behave

EC2 Reserved Instances

- Up to 72% discount compared to On-demand
- You reserve a specific instance attributes **(Instance Type, Region, Tenancy, OS)**
- **Reservation Period – 1 year** (+discount) or **3 years** (+++discount)
- **Payment Options – No Upfront** (+), **Partial Upfront** (++), **All Upfront** (+++)
- **Reserved Instance's Scope – Regional** or **Zonal** (reserve capacity in an AZ)
- Recommended for steady-state usage applications (think database)
- You can buy and sell in the Reserved Instance Marketplace

- **Convertible Reserved Instance**
  - Can change the EC2 instance type, instance family, OS, scope and tenancy
  - Up to 66% discount

Note: the % discounts are different from the video as AWS change them over time – the exact numbers are not needed for the exam. This is just for illustrative purposes ☺

EC2 Savings Plans

- Get a discount based on long-term usage (up to 72% - same as RIs)
- Commit to a certain type of usage ($10/hour for 1 or 3 years)
- Usage beyond EC2 Savings Plans is billed at the On-Demand price

- Locked to a specific instance family & AWS region (e.g., M5 in us-east-1)
- Flexible across:
  - Instance Size (e.g., m5.xlarge, m5.2xlarge)
  - OS (e.g., Linux, Windows)
  - Tenancy (Host, Dedicated, Default)

EC2 Spot Instances

- Can get a **discount of up to 90%** compared to On-demand
- Instances that you can "lose" at any point of time if your max price is less than the current spot price
- The **MOST cost-efficient** instances in AWS

- Useful for workloads that are resilient to failure
  - Batch jobs
  - Data analysis
  - Image processing
  - Any **distributed** workloads
  - Workloads with a flexible start and end time

- Not suitable for critical jobs or databases

EC2 Dedicated Hosts

- A physical server with EC2 instance capacity fully dedicated to your use
- Allows you address **compliance requirements** and **use your existing server-bound software licenses** (per-socket, per-core, pe—VM software licenses)
- Purchasing Options:
  - **On-demand** – pay per second for active Dedicated Host
  - **Reserved** - 1 or 3 years (No Upfront, Partial Upfront, All Upfront)
- The most expensive option

- Useful for software that have complicated licensing model (BYOL – Bring Your Own License)
- Or for companies that have strong regulatory or compliance needs

EC2 Dedicated Instances

- Instances run on hardware that's dedicated to you

- May share hardware with other instances in same account

- No control over instance placement (can move hardware after Stop / Start)

Characteristic	Dedicated Instances	Dedicated Hosts
Enables the use of dedicated physical servers	X	X
Per instance billing (subject to a $2 per region fee)	X	
Per host billing		X
Visibility of sockets, cores, host ID		X
Affinity between a host and instance		X
Targeted instance placement		X
Automatic instance placement	X	X
Add capacity using an allocation request		X

EC2 Capacity Reservations

- Reserve **On-Demand** instances capacity in a specific AZ for any duration
- You always have access to EC2 capacity when you need it
- **No time commitment** (create/cancel anytime), **no billing discounts**
- Combine with Regional Reserved Instances and Savings Plans to benefit from billing discounts
- You're charged at On-Demand rate whether you run instances or not

- Suitable for short-term, uninterrupted workloads that needs to be in a specific AZ

Which purchasing option is right for me?

- **On demand:** coming and staying in resort whenever we like, we pay the full price
- **Reserved:** like planning ahead and if we plan to stay for a long time, we may get a good discount.
- **Savings Plans:** pay a certain amount per hour for certain period and stay in any room type (e.g., King, Suite, Sea View, …)
- **Spot instances:** the hotel allows people to bid for the empty rooms and the highest bidder keeps the rooms. You can get kicked out at any time
- **Dedicated Hosts:** We book an entire building of the resort
- **Capacity Reservations:** you book a room for a period with full price even you don't stay in it

Price Comparison
Example – m4.large – us-east-1

Price Type	Price (per hour)
On-Demand	$0.10
Spot Instance (Spot Price)	$0.038 - $0.039 (up to 61% off)
Reserved Instance (1 year)	$0.062 (No Upfront) - $0.058 (All Upfront)
Reserved Instance (3 years)	$0.043 (No Upfront) - $0.037 (All Upfront)
EC2 Savings Plan (1 year)	$0.062 (No Upfront) - $0.058 (All Upfront)
Reserved **Convertible** Instance (1 year)	$0.071 (No Upfront) - $0.066 (All Upfront)
Dedicated Host	On-Demand Price
Dedicated Host Reservation	Up to 70% off
Capacity Reservations	On-Demand Price

AWS charges for IPv4 addresses

- Starting February 1st 2024, there's a charge for all Public IPv4 created in your account

- $0.005 per hour of Public IPv4 (~ $3.6 per month)

- For new accounts in AWS, you have a free tier for the EC2 service: 750 hours of Public IPv4 per month for the first 12 months

- For all other services there is no free tier

Public IP

EC2 Instance

Public IP

EC2 Instance

Free until 750 hours/month of usage

Load Balancer

One Public IPv4 per AZ, no Free Tier

RDS Database

One Public IPv4 No Free Tier

AWS charges for IPv4 addresses

- What about IPv6?
    - Unfortunately, many Internet Service Provider (ISP) around the world don't support IPv6, so the course would not work for some of you
    - You can test IPv6 by going to https://test-ipv6.com/
    - If you use IPv6 in this course, you're on your own (security groups, networking…) but you can do it!
- How to troubleshoot charges?
    - Go into your AWS Bill
    - Look into the AWS Public IP Insights service
    - Nice article here: https://repost.aws/articles/ARknH_OR0cTvqoTfJrVGaB8A/why-am-i-seeing-charges-for-public-ipv4-addresses-when-i-am-under-the-aws-free-tier
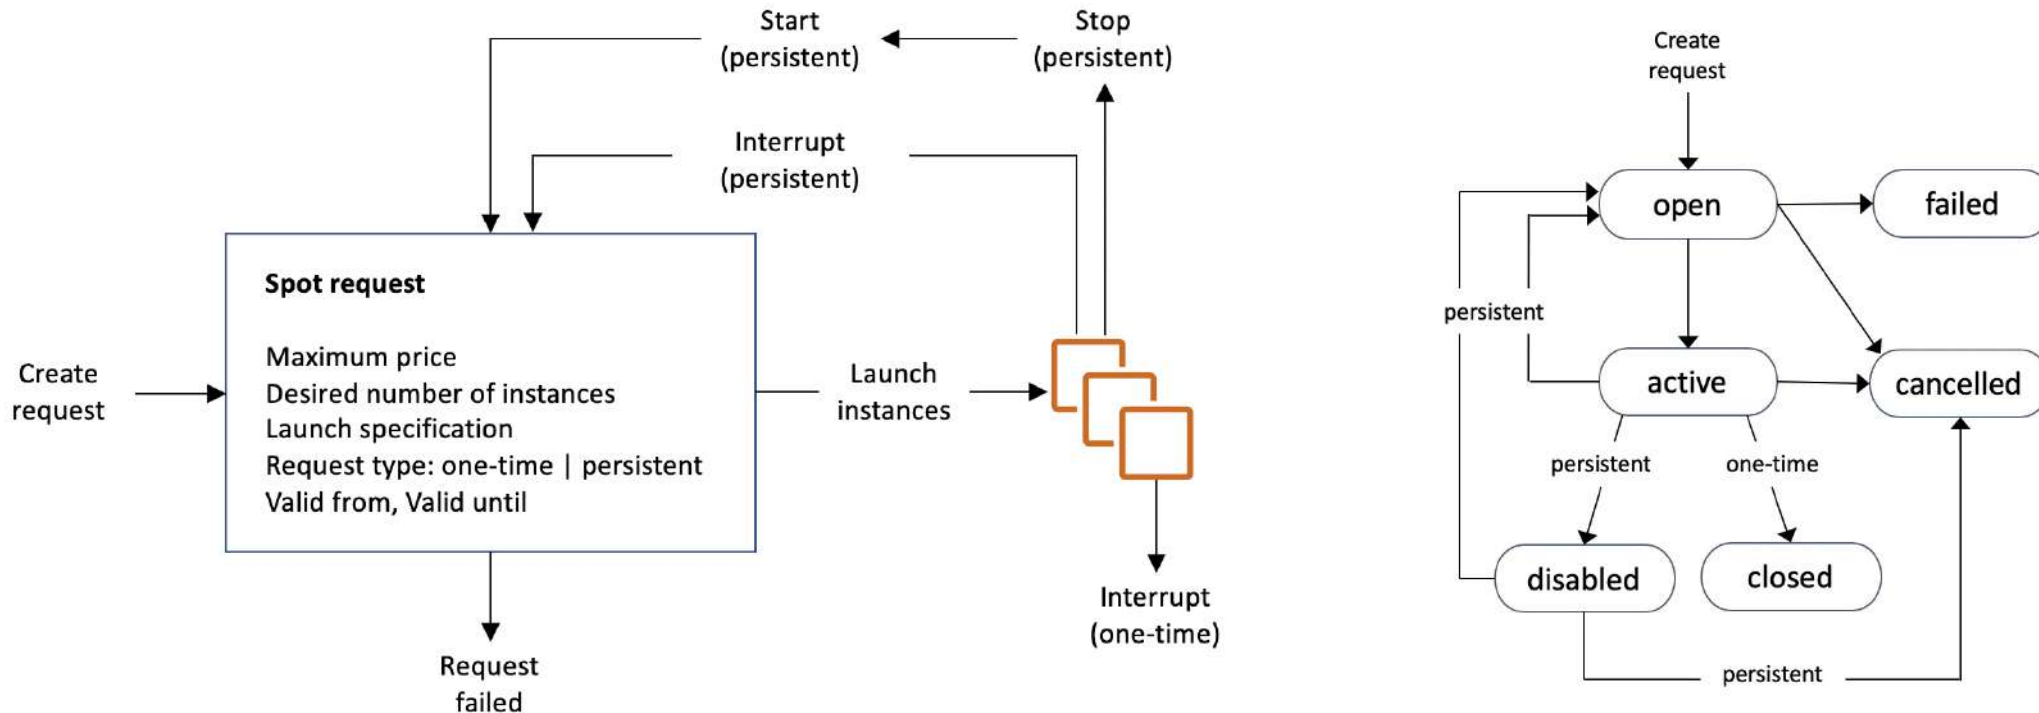

EC2 Spot Instance Requests

- Can get a discount of up to 90% compared to On-demand

- Define **max spot price** and get the instance while **current spot price < max**
  - The hourly spot price varies based on offer and capacity
  - If the current spot price > your max price you can choose to **stop** or **terminate** your instance with a 2 minutes grace period.
- Other strategy: **Spot Block**
  - "block" spot instance during a specified time frame (1 to 6 hours) without interruptions
  - In rare situations, the instance may be reclaimed

- Used for batch jobs, data analysis, or workloads that are resilient to failures.
- Not great for critical jobs or databases

EC2 Spot Instances Pricing

https://console.aws.amazon.com/ec2sp/v1/spot/home?region=us-east-1#

www.datacumulus.com
How to terminate Spot Instances?

You can only cancel Spot Instance requests that are **open, active, or disabled.**
Cancelling a Spot Request does not terminate instances
You must first cancel a Spot Request, and then terminate the associated Spot Instances

https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-requests.html

www.datacumulus.com

Spot Fleets

- Spot Fleets = set of Spot Instances + (optional) On-Demand Instances
- The Spot Fleet will try to meet the target capacity with price constraints
  - Define possible launch pools: instance type (m5.large), OS, Availability Zone
  - Can have multiple launch pools, so that the fleet can choose
  - Spot Fleet stops launching instances when reaching capacity or max cost
- Strategies to allocate Spot Instances:
  - **lowestPrice:** from the pool with the lowest price (cost optimization, short workload)
  - **diversified:** distributed across all pools (great for availability, long workloads)
  - **capacityOptimized:** pool with the optimal capacity for the number of instances
  - **priceCapacityOptimized (recommended):** pools with highest capacity available, then select the pool with the lowest price (best choice for most workloads)
- Spot Fleets allow us to automatically request Spot Instances with the lowest price

Burstable Instances (T2/T3)

- AWS has the concept of burstable instances (T2/T3 machines)

- Burst means that overall, the instance has OK CPU performance.
- When the machine needs to process something unexpected (a spike in load for example), it can burst, and CPU can be VERY good.
- If the machine bursts, it utilizes "burst credits"
- If all the credits are gone, the CPU becomes BAD
- If the machine stops bursting, credits are accumulated over time

Burstable Instances (T2/T3)

- Burstable instances can be amazing to handle unexpected traffic and getting the insurance that it will be handled correctly
- If your instance consistently runs low on credit, you need to move to a different kind of non-burstable instance
Credit usage
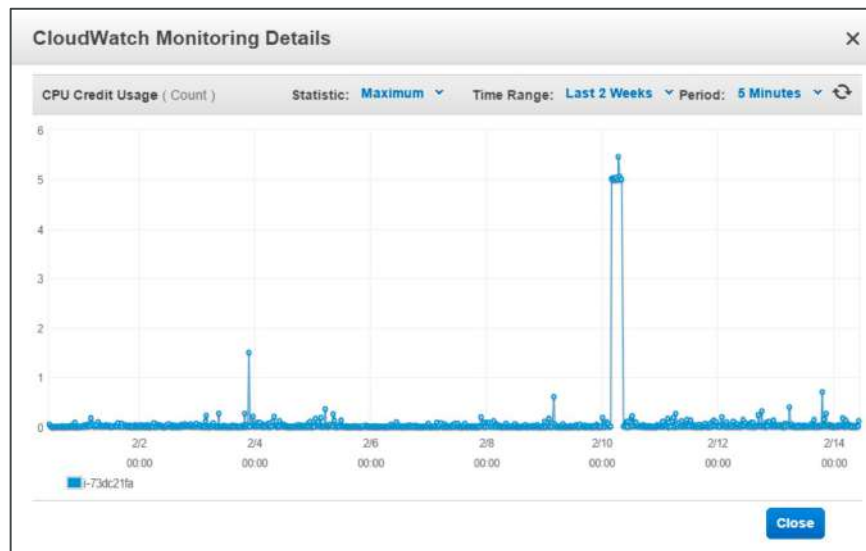

Credit balance

CPU Credits

| Instance type	Launch credits	vCPUs	CPU credits earned per hour	Maximum earned CPU credit balance	vCPUs	Baseline performance (% CPU utilization)
t2.nano	30	1	3	72	1	5%
t2.micro	30	1	6	144	1	10%
t2.small	30	1	12	288	1	20%
t2.medium	60	2	24	576	2	40% (of 200% max)*
t2.large	60	2	36	864	2	60% (of 200% max)*
t2.xlarge	120	4	54	1296	4	90% (of 400% max)*
t2.2xlarge	240	8	81	1944	8	135% (of 800% max)*

What happens when credit are exhausted?

- Experiment: run a CPU stress command (to peak at 100%)
- After the credits are exhausted, the measured CPU utilization drops

100% CPU Utilization

0

10:00   10:30   11:00

● CPUCreditBalance

Credit exhaustion

T2/T3 Unlimited

- It is possible to have an "unlimited burst credit balance"

- You pay extra money if you go over your credit balance, but you don't lose in performance

- If average CPU usage over a 24-hour period exceeds the baseline, the instance is billed for additional usage per vCPU/hour

- Be careful, costs could go high if you're not monitoring the CPU health of your instances

https://aws.amazon.com/blogs/aws/new-t2-unlimited-going-beyond-the-burst-with-high-performance/
Elastic IPs

- When you stop and then start an EC2 instance, it changes its public IP

- If you need to have a fixed public IP, you need an Elastic IP

- An Elastic IP is a public IPv4 you own as long as you don't delete it

- You can attach it to one instance at a time

- You can remap it across instances

- You don't pay for the Elastic IP if it's attached to a server

- You pay for the Elastic IP if it's not attached to a server

Users

http://1.2.3.4

VPC

Public subnet

EIP
(IPv4: 1.2.3.4)
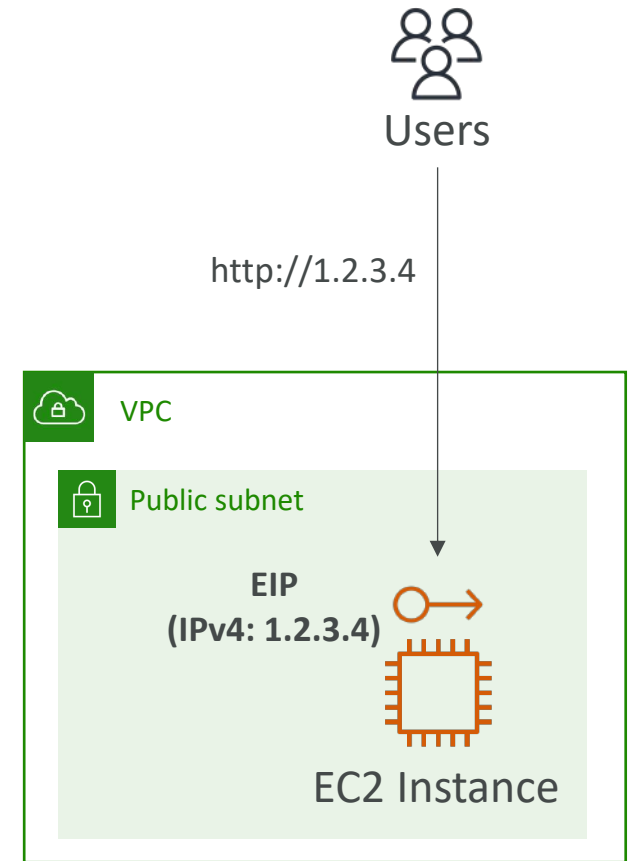

EC2 Instance

Elastic IPs

- With an Elastic IP address, you can mask the failure of an instance or software by rapidly remapping the address to another instance in your account.

- You can only have 5 Elastic IP in your account (you can ask AWS to increase that).

- How you can avoid using Elastic IP:
  - Always think if other alternatives are available to you
  - You could use a random public IP and register a DNS name to it
  - Or use a Load Balancer with a static hostname

CloudWatch Metrics for EC2

- AWS Provided metrics (AWS pushes them):
  - Basic Monitoring (default): metrics are collected at a 5 minute internal
  - Detailed Monitoring (paid): metrics are collected at a 1 minute interval
  - Includes CPU, Network, Disk and Status Check Metrics

- Custom metric (yours to push):
  - Basic Resolution: 1 minute resolution
  - High Resolution: all the way to 1 second resolution
  - Include RAM, application level metrics
  - Make sure the IAM permissions on the EC2 instance role are correct !

EC2 included metrics

- <u>CPU</u>: CPU Utilization + Credit Usage / Balance

- <u>Network</u>: Network In / Out

- <u>Status Check</u>:
  - Instance status = check the EC2 VM
  - System status = check the underlying hardware
  - Attached EBS status = check attached EBS volumes

- <u>Disk</u>: Read / Write for Ops / Bytes (only for instance store)

- <u>RAM is NOT included in the AWS EC2 metrics</u>

Unified CloudWatch Agent

- For virtual servers (EC2 instances, on-premises servers, …)
- Collect additional system-level metrics such as RAM, processes, used disk space, etc.
- Collect logs to send to CloudWatch Logs
  - No logs from inside your EC2 instance will be sent to CloudWatch Logs without using an agent
- Centralized configuration using SSM Parameter Store
- Make sure IAM permissions are correct

- Default namespace for metrics collected by the Unified CloudWatch agent is **CWAgent** (can be configured/changed)

CloudWatch

push logs

+

push metrics

Corporate Data Center

EC2 Instance with
Unified CW Agent

Server with
Unified CW Agent
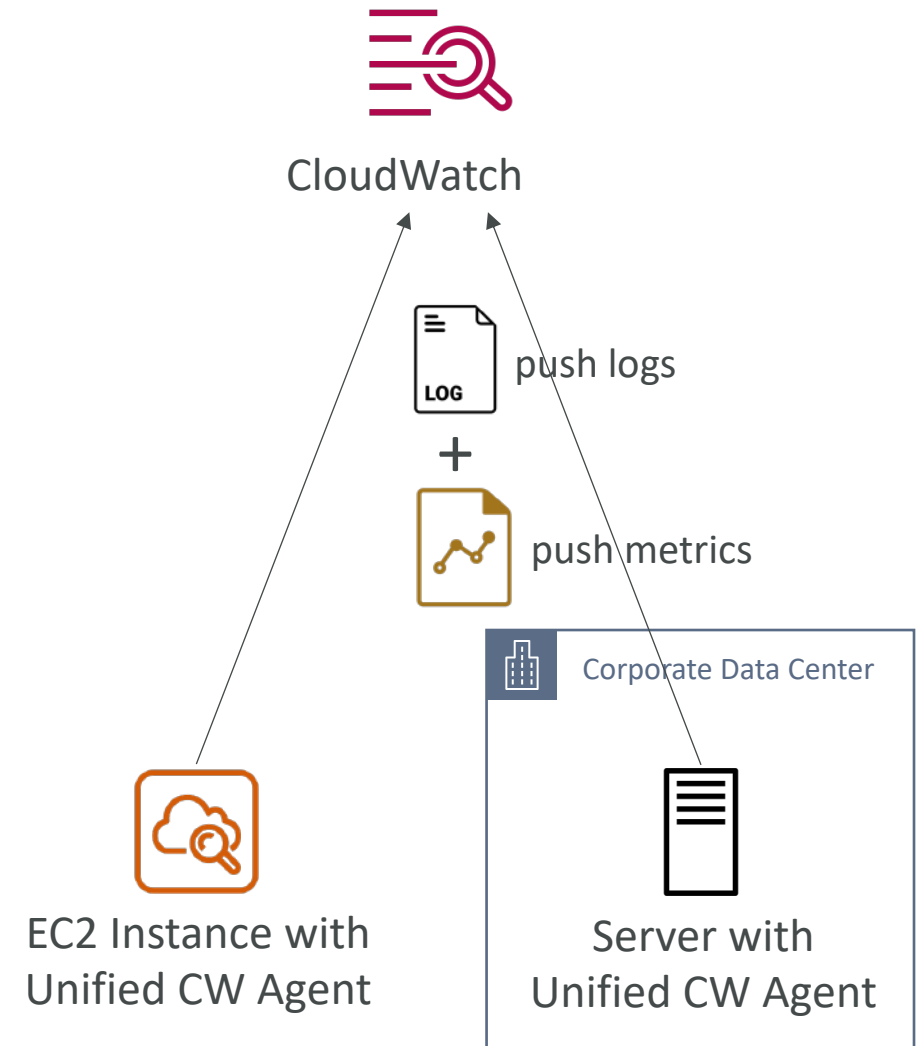

Unified CloudWatch Agent – procstat Plugin

- Collect metrics and monitor system utilization of individual processes
- Supports both Linux and Windows servers
- Example: amount of time the process uses CPU, amount of memory the process uses, …
- Select which processes to monitor by
  - **pid_file:** name of process identification number (PID) files they create
  - **exe:** process name that match string you specify (RegEx)
  - **pattern:** command lines used to start the processes (RegEx)
- Metrics collected by procstat plugin begins with **"procstat"** prefix (e.g., procstat_cpu_time, procstat_cpu_usage, …)
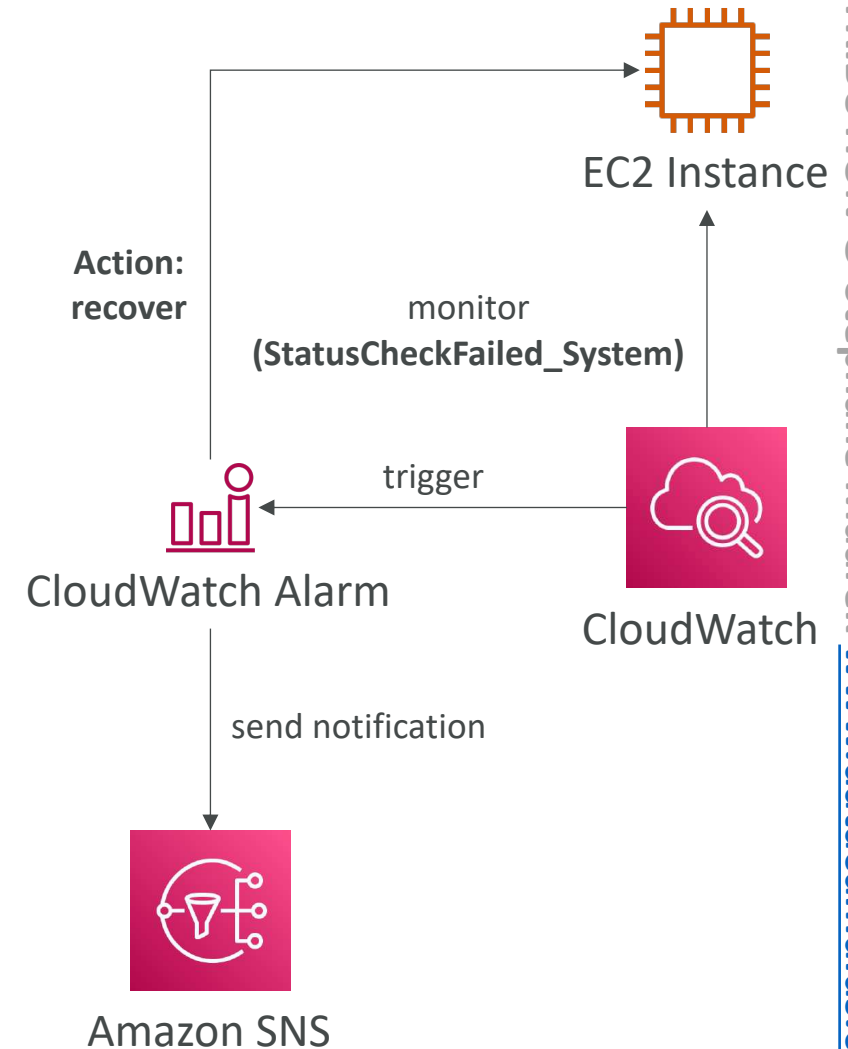

Status Checks

- Automated checks to identify hardware and software issues
- **System Status Checks**
  - Monitors problems with AWS systems (software/hardware issues on the physical host, loss of system power, …)
  - Check **Personal Health Dashboard** for any scheduled critical maintenance by AWS to your instance's host
  - Resolution: stop and start the instance (instance migrated to a new host)
- **Instance Status Checks**
  - Monitors software/network configuration of your instance (invalid network configuration, exhausted memory, …)
  - Resolution: reboot the instance or change instance configuration
- **Attached EBS Status Checks**
  - Monitors EBS volumes attached to your instance (reachable & complete I/O Operations)
  - Resolution: reboot the instance or replace affected EBS volumes

launch new instance

EC2 Hibernate

- We know we can stop, terminate instances
    - **Stop** – s the data on disk (EBS) is kept intact in the next start
    - **Terminate** – any EBS volumes (root) also set-up to be destroyed is lost

- On start, the following happens:
    - First start: the OS boots & the EC2 User Data script is run
    - Following starts: the OS boots up
    - Then your application starts, caches get warmed up, and that can take time!

EC2 Hibernate

- Introducing **EC2 Hibernate**:
  - The in-memory (RAM) state is preserved
  - The instance boot is much faster!
    (the OS is not stopped / restarted)
  - Under the hood: the RAM state is written
    to a file in the root EBS volume
  - The root EBS volume must be encrypted

- Use cases:
  - Long-running processing
  - Saving the RAM state
  - Services that take time to initialize
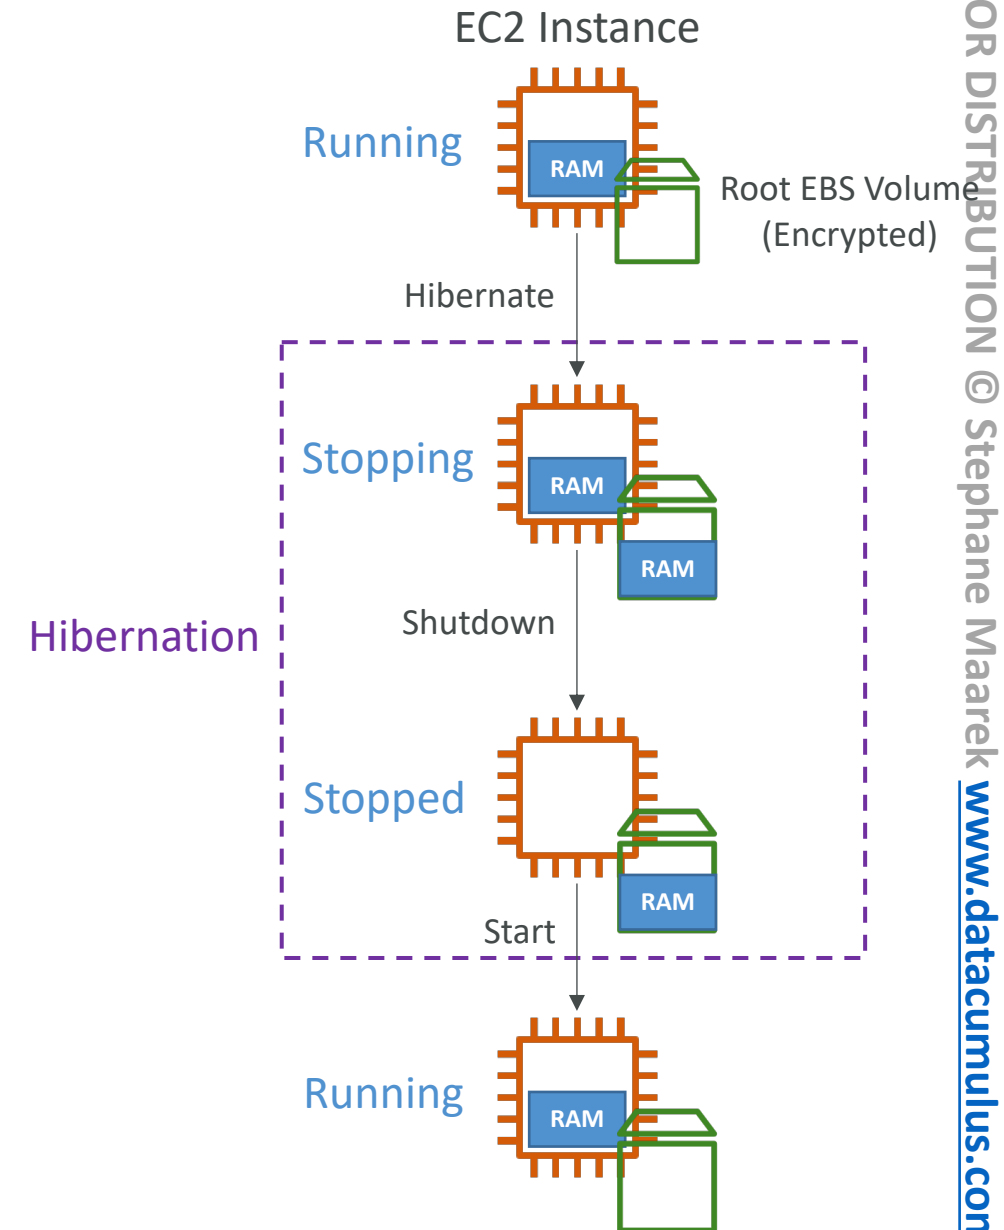

EC2 Hibernate – Good to know

- Supported Instance Families – C3, C4, C5, I3, M3, M4, R3, R4, T2, T3, …
- Instance RAM Size – must be less than 150 GB.
- Instance Size – not supported for bare metal instances.
- AMI – Amazon Linux 2, Linux AMI, Ubuntu, RHEL, CentOS & Windows…
- Root Volume – must be EBS, encrypted, not instance store, and large
- Available for **On-Demand**, **Reserved** and **Spot** Instances

- An instance can **NOT** be hibernated more than 60 days

Amazon Machine Image (AMI)

AMI Overview

- AMI = Amazon Machine Image

- AMI are a **customization** of an EC2 instance
  - You add your own software, configuration, operating system, monitoring…
  - Faster boot / configuration time because all your software is pre-packaged

- AMI are built for a **specific region** (and can be copied across regions)

- You can launch EC2 instances from:
  - **A Public AMI:** AWS provided
  - **Your own AMI:** you make and maintain them yourself
  - **An AWS Marketplace AMI:** an AMI someone else made (and potentially sells)
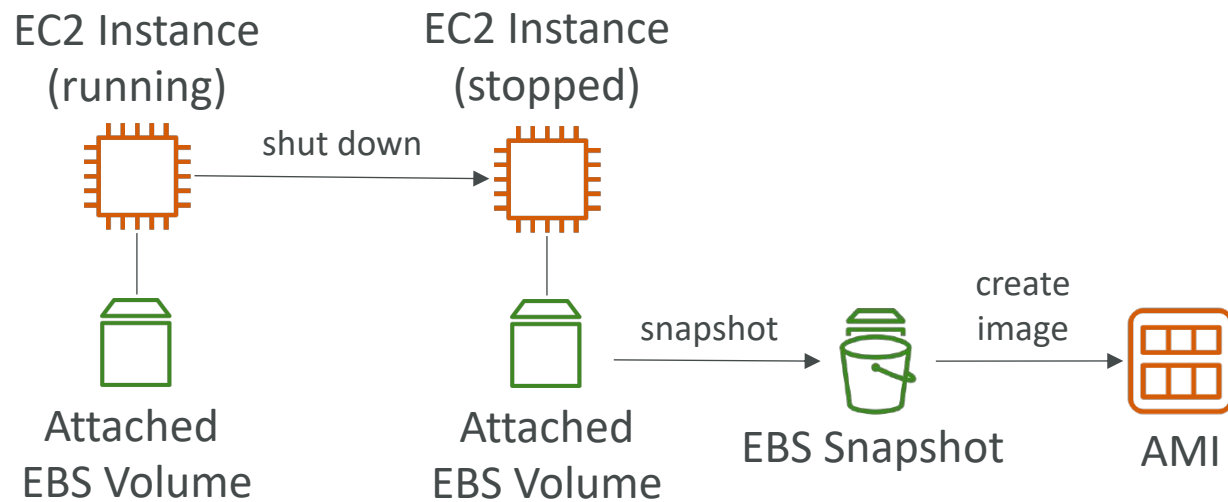

AMI Process (from an EC2 instance)

- Start an EC2 instance and customize it
- Stop the instance (for data integrity)
- Build an AMI – this will also create EBS snapshots
- Launch instances from other AMIs
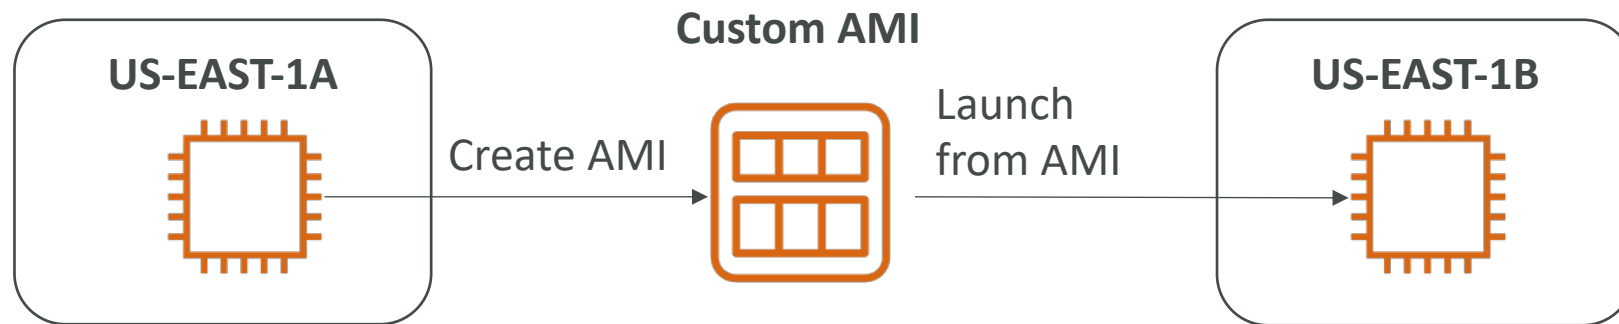

AMI No-Reboot Option

- Enables you to create an AMI without shutting down your instance
- By default, it's not selected (AWS will shut down the instance before creating an AMI to maintain the file system integrity)
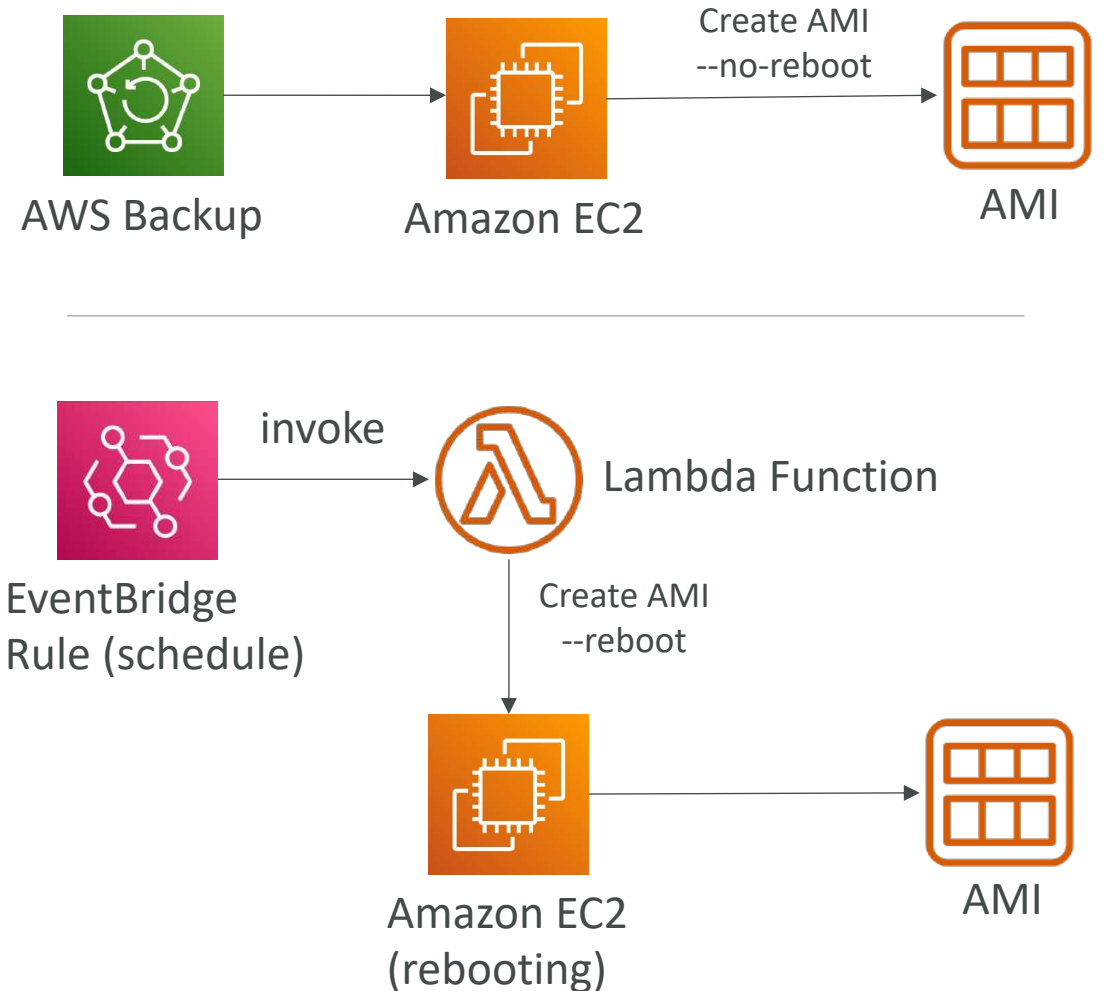

With No-Reboot **Disabled** (default)

With No-Reboot **Enabled**

EC2 Instance (running)

EC2 Instance (stopped)

EBS Snapshot

create image

AMI

EC2 Instance (running)

Note: OS Buffers are not flushed to disk before the snapshot is created

Attached EBS Volume

snapshot
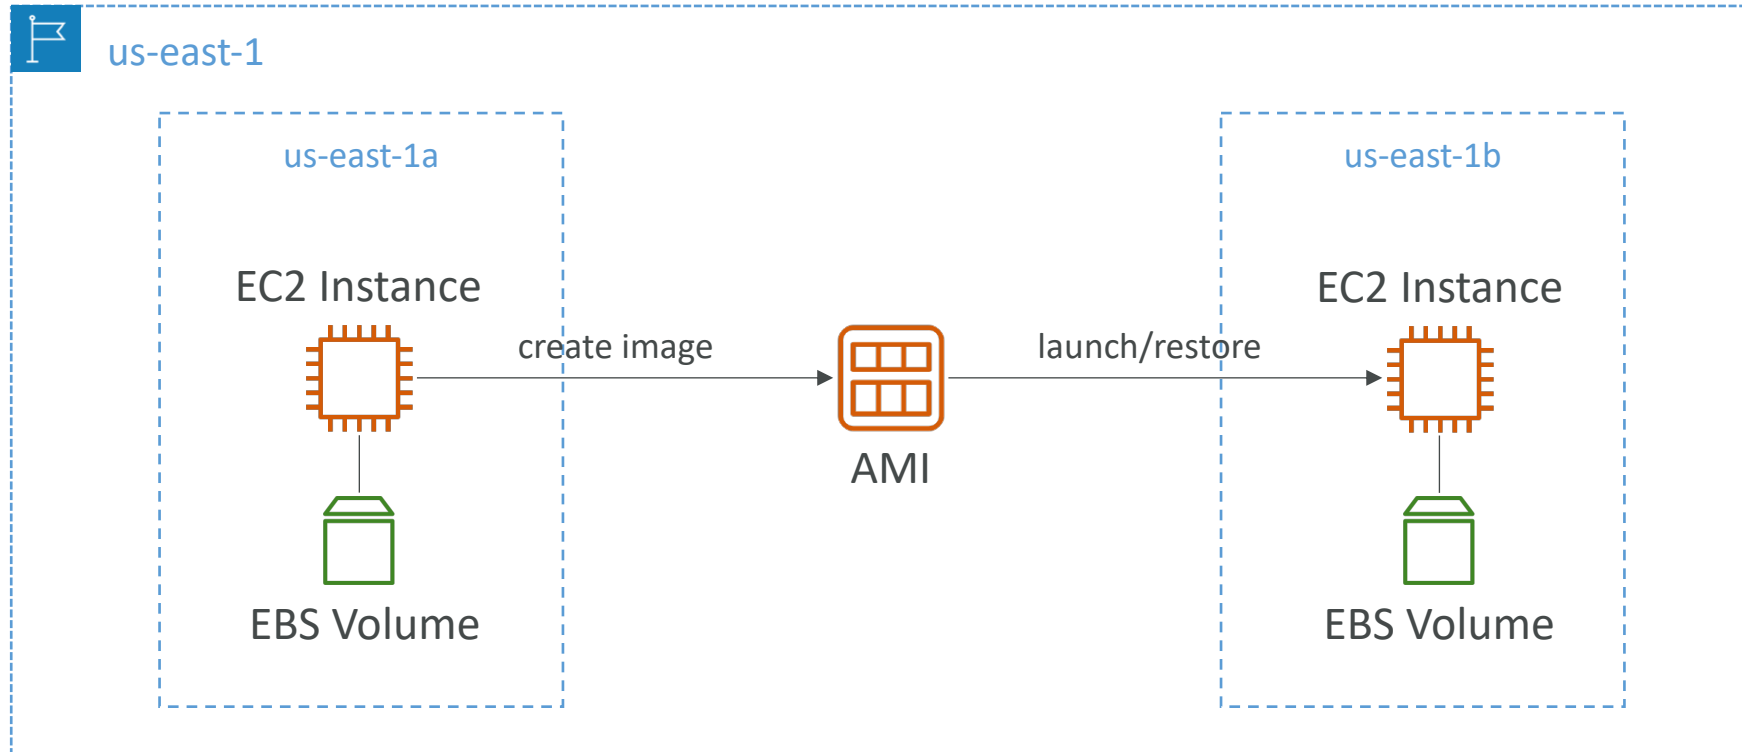

EBS Snapshot

create image

AMI

AWS Backup Plans to create AMI

- AWS Backup doesn't reboot the instances while taking EBS snapshots (no-reboot behavior)
  - This won't help you to create an AMI that guarantees file system integrity since you need to reboot the instance
  - To maintain integrity you need to provide the reboot parameter while taking images (EventBridge + Lambda + CreateImage API with reboot)

AWS Backup → Amazon EC2 → Create AMI --no-reboot → AMI

EventBridge Rule (schedule) → invoke → Lambda Function → Create AMI --reboot → Amazon EC2 (rebooting) → AMI
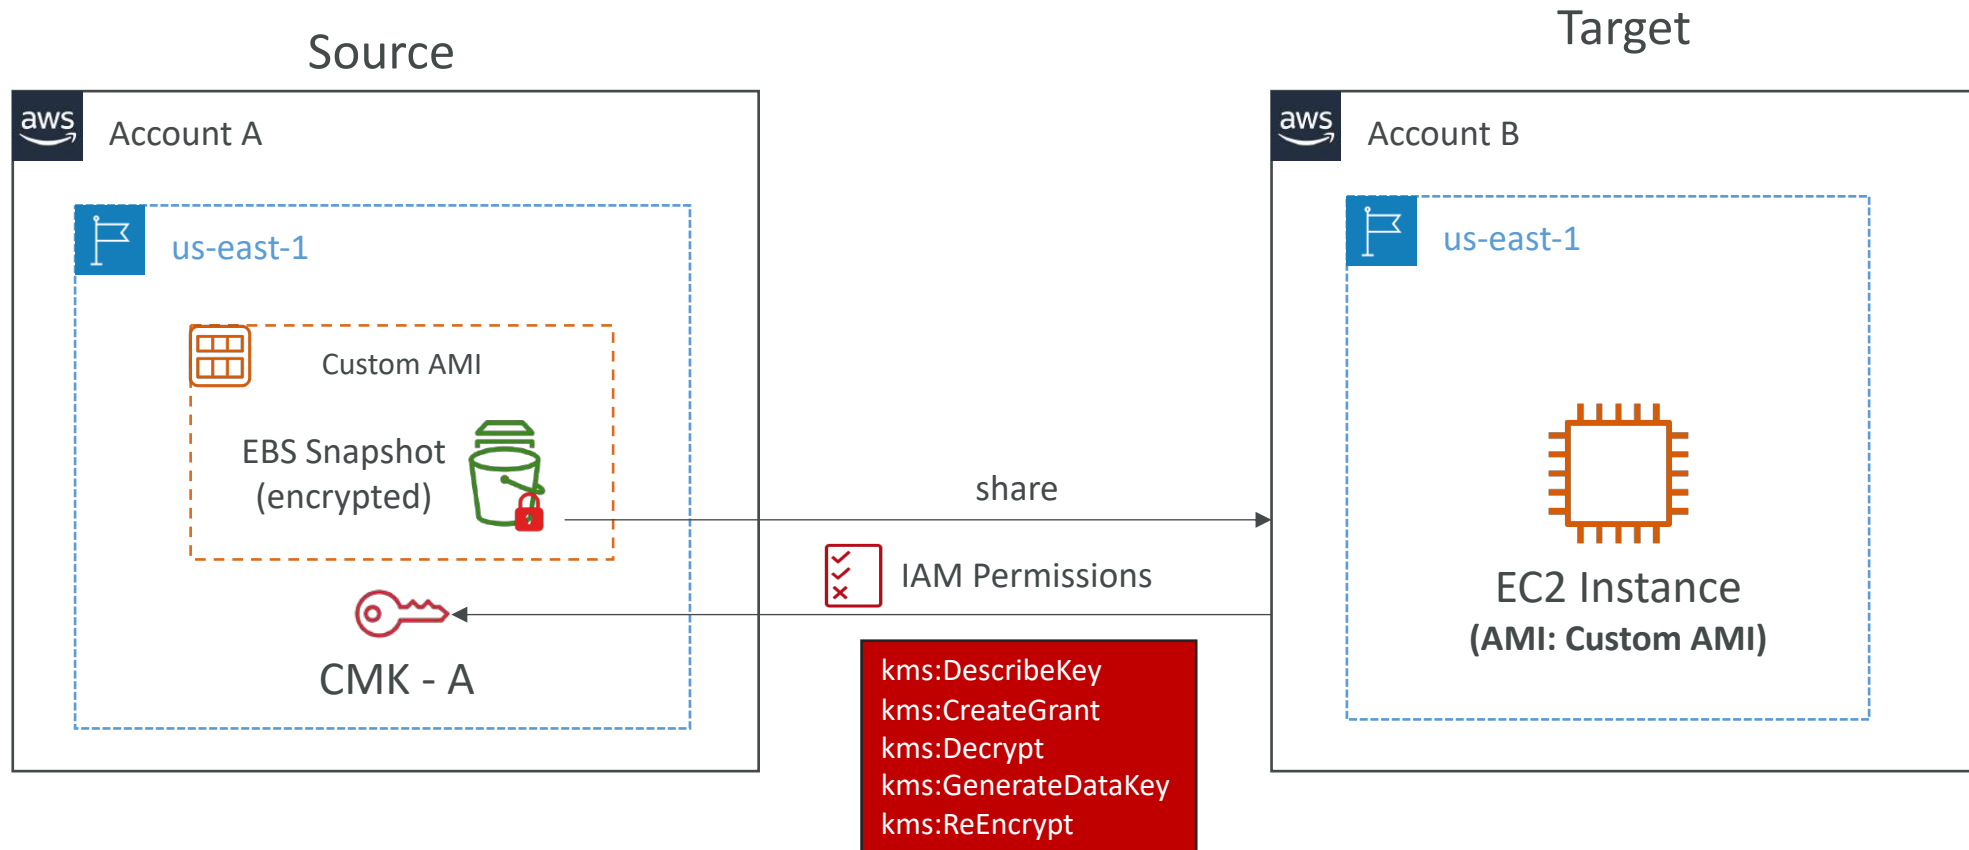

EC2 Instance Migration between AZ

Cross-Account AMI Sharing

- You can share an AMI with another AWS account

- Sharing an AMI does not affect the ownership of the AMI

- You can only share AMIs that have unencrypted volumes and volumes that are encrypted with a customer managed key

- If you share an AMI with encrypted volumes, you must also share any customer managed keys used to encrypt them.
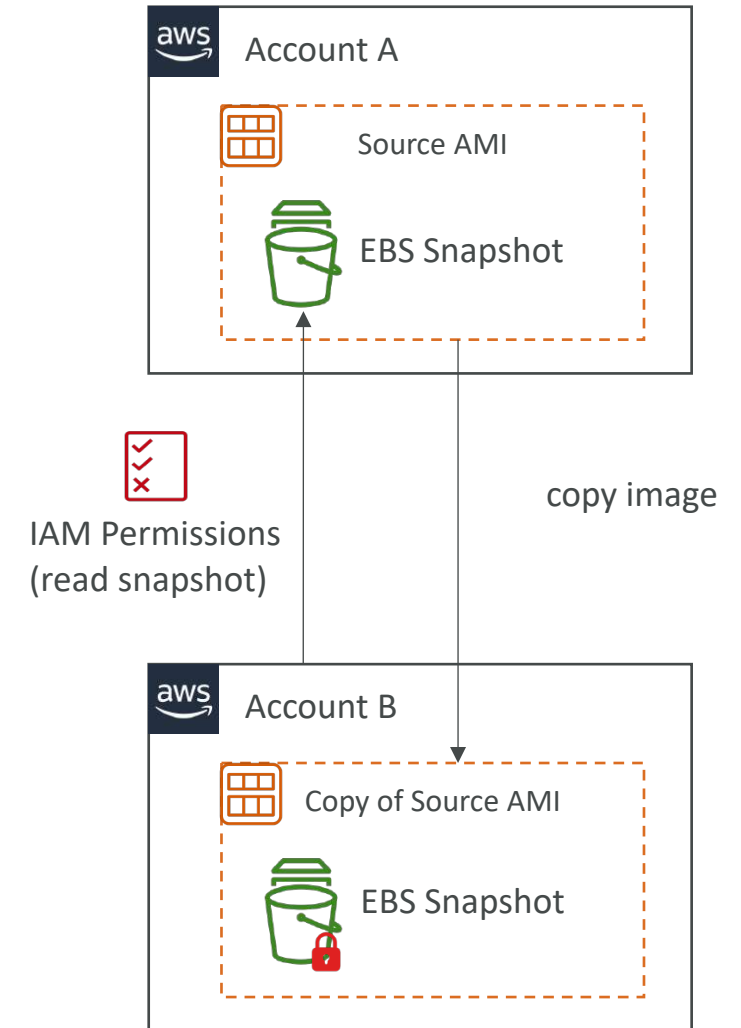

aws Account A

Source AMI

Share with Account B

aws Account B

EC2 Instance
(AMI: Source AMI)
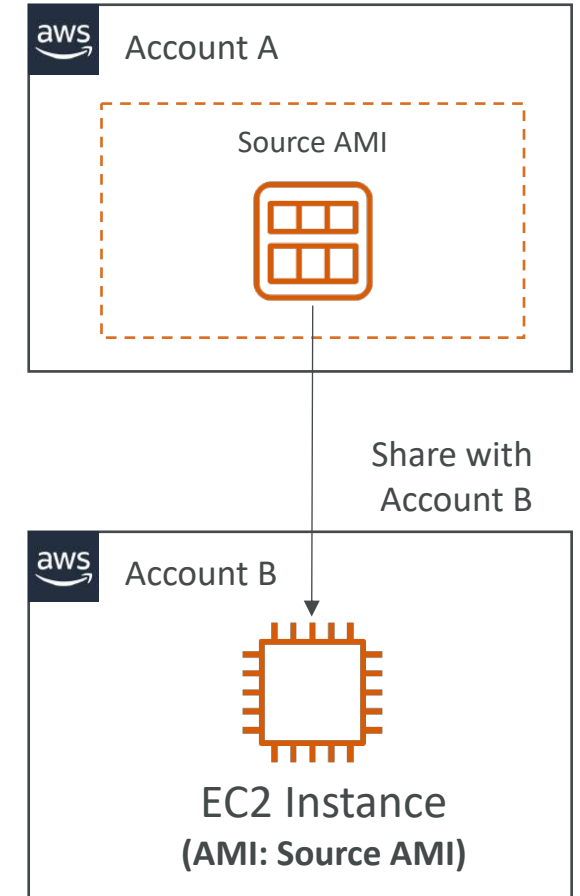

# AMI Sharing with KMS Encryption

www.datacumulus.com

Cross-Account AMI Copy

- If you copy an AMI that has been shared with your account, you are the owner of the target AMI in your account
- The owner of the source AMI must grant you read permissions for the storage that backs the AMI (EBS Snapshot)
- If the shared AMI has encrypted snapshots, the owner must share the key or keys with you as well
- Can encrypt the AMI with your own CMK while copying

IAM Permissions

Management of EC2 at Scale

Systems Manager

AWS Systems Manager Overview

- Helps you manage your **EC2 and On-Premises** systems at scale
- Get operational insights about the state of your infrastructure
- Easily detect problems
- **Patching automation for enhanced compliance**
- Works for both Windows and Linux OS
- Integrated with CloudWatch metrics / dashboards
- Integrated with AWS Config
- Free service

AWS Systems Manager Features

- **Resource Groups**
- Operations Management
  - Explorer
  - OpsCenter
  - CloudWatch Dashboard
  - PHD
  - Incident Manager
- Shared Resources
  - **Documents**

- Change Management
  - Change Manager
  - **Automation**
  - Change Calendar
  - **Maintenance Windows**

- Application Management
  - Application Manager
  - AppConfig
  - **Parameter Store**

- Node Management
  - Fleet Manager
  - Compliance
  - **Inventory**
  - Hybrid Activations
  - **Session Manager**
  - **Run Command**
  - **State Manager**
  - **Patch Manager**
  - Distributer

How Systems Manager works

- We need to install the SSM agent onto the systems we control

- Installed by default on Amazon Linux 2 AMI & some Ubuntu AMI

- If an instance can't be controlled with SSM, it's probably an issue with the SSM agent!

- Make sure the EC2 instances have a proper IAM role to allow SSM actions

AWS Systems Manager

IAM Permissions

EC2 Instance (SSM Agent)

EC2 Instance (SSM Agent)

On-premise Server/VM (SSM Agent)
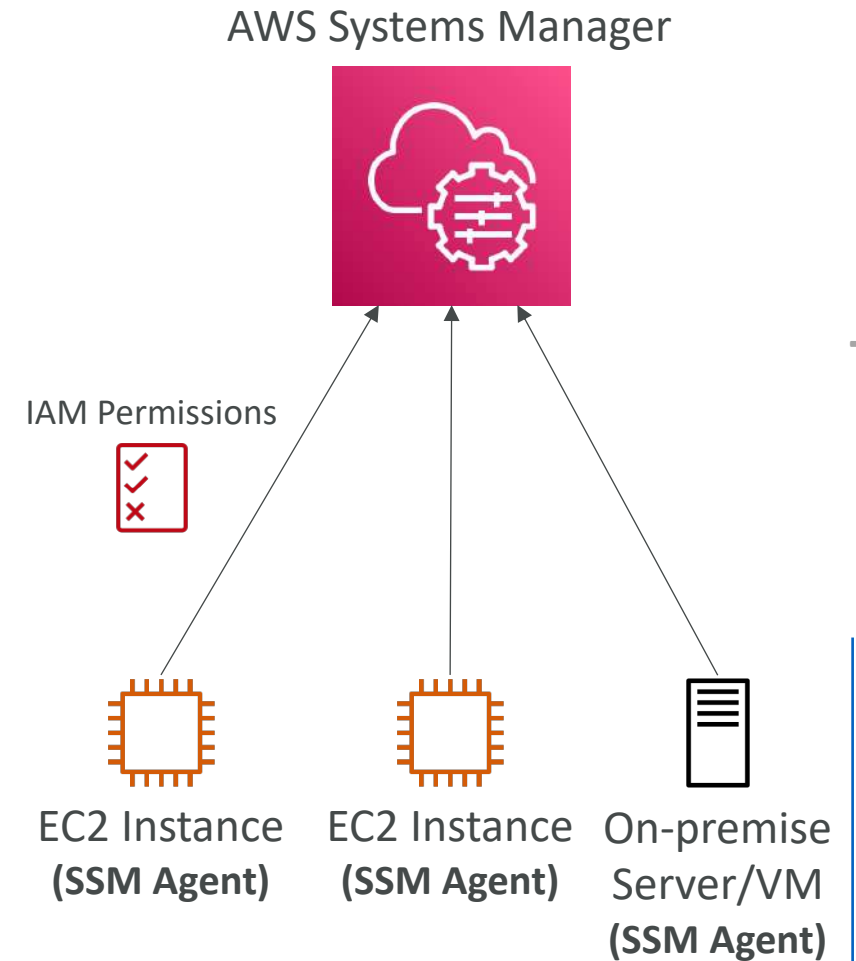

AWS Tags

- You can add text key-value pairs called Tags to many AWS resources

- Commonly used in EC2

- Free naming, common tags are Name, Environment, Team …

- They're used for
  - Resource grouping
  - Automation
  - Cost allocation

- Better to have too many tags than too few!

Resource Groups

- Create, view or manage logical group of resources thanks to **tags**

- Allows creation of logical groups of resources such as
  - Applications
  - Different layers of an application stack
  - Production versus development environments

- Regional service
- Works with EC2, S3, DynamoDB, Lambda, etc...

EC2 Instances

SSM – Documents

- Documents can be in JSON or YAML
- You define parameters
- You define actions
- Many documents already exist in AWS

```yaml
---
schemaVersion: '2.2'
description: State Manager Bootstrap Example
parameters: {}
mainSteps:
  - action: aws:runShellScript
    name: configureServer
    inputs:
      runCommand:
        - sudo yum install -y httpd
        - sudo yum --enablerepo=epel install -y clamav
```
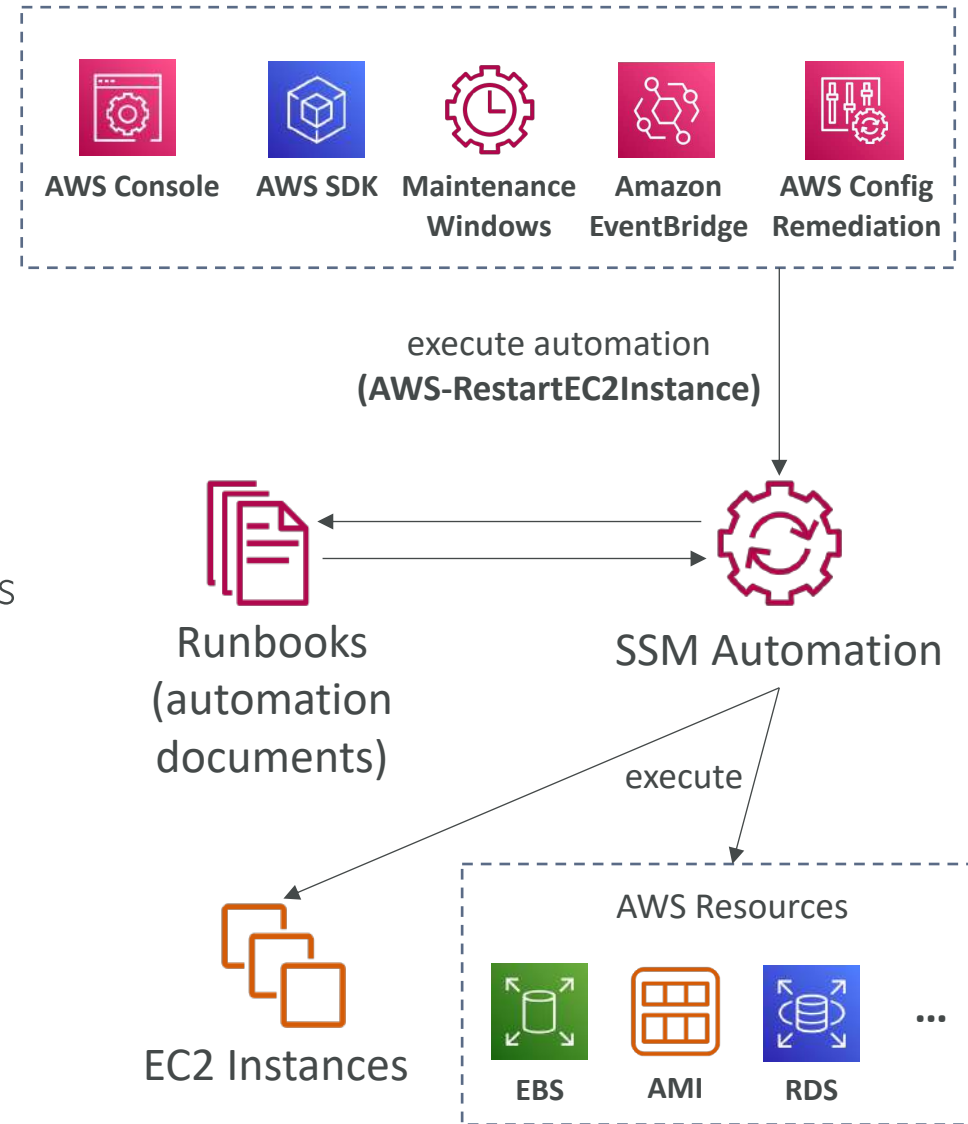

Documents → Run Command

State Manager   Patch Manager   Automation   Parameter Store
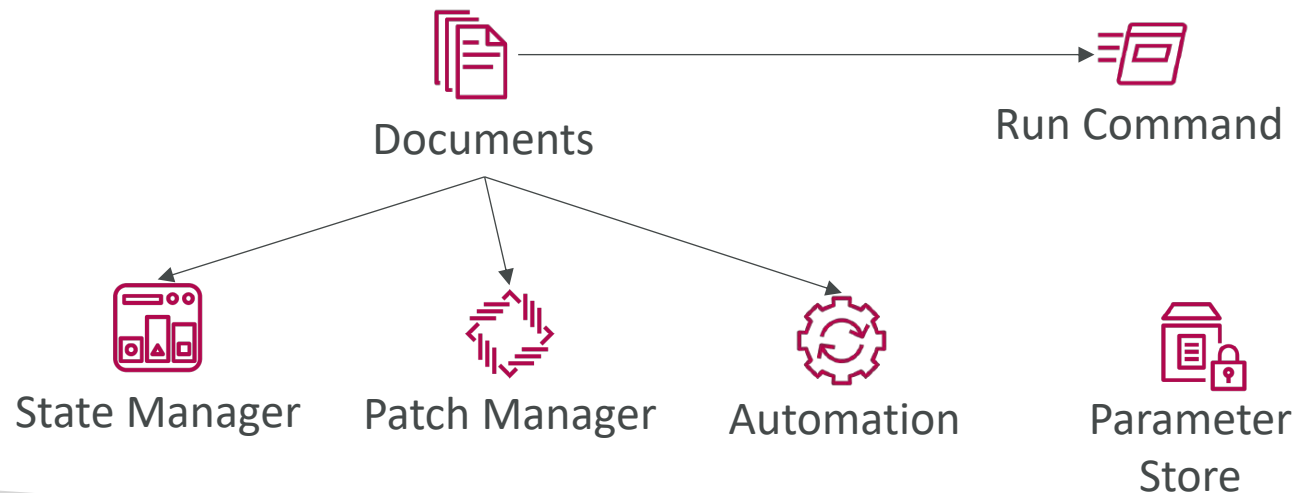

SSM – Run Command

- Execute a document (= script) or just run a command
- Run command across multiple instances (using resource groups)
- Rate Control / Error Control
- Integrated with IAM & CloudTrail
- No need for SSH
- Command Output can be shown in the Console, sent to S3 bucket or CloudWatch Logs
- Send notifications to SNS about command statues (In progress, Success, Failed, …)
- Can be invoked using EventBridge
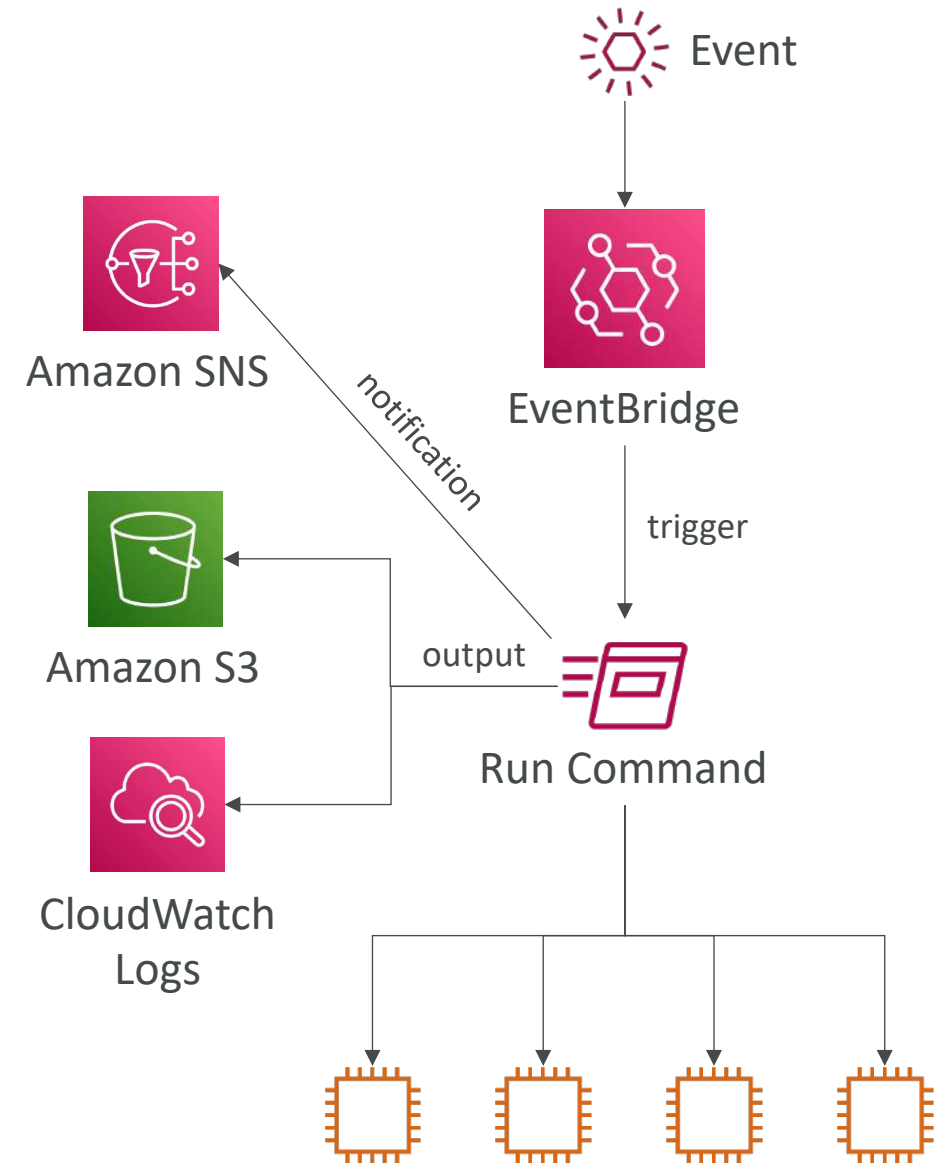

SSM - Automation

- Simplifies common maintenance and deployment tasks of EC2 instances and other AWS resources
- Example: restart instances, create an AMI, EBS snapshot
- **Automation Runbook**
  - SSM Documents of type Automation
  - Defines actions performed on your EC2 instances or AWS resources
  - Pre-defined runbooks (AWS) or create custom runbooks
- Can be triggered
  - Manually using AWS Console, AWS CLI or SDK
  - By Amazon EventBridge
  - On a schedule using Maintenance Windows
  - By AWS Config for rules remediations

AWS Console   AWS SDK   Maintenance Windows   Amazon EventBridge   AWS Config Remediation

GetParameters or
GetParametersByPath API

Dev Lambda Function

Prod Lambda Function

Standard and advanced parameter tiers

	Standard	Advanced
Total number of parameters allowed (per AWS account and Region)	10,000	100,000
Maximum size of a parameter value	4 KB	8 KB
Parameter policies available	No	Yes
Cost	No additional charge	Charges apply
Storage Pricing	Free	$0.05 per advanced parameter per month

Parameters Policies (for advanced parameters)

- Allow to assign a TTL to a parameter (expiration date) to force updating or deleting sensitive data such as passwords
- Can assign multiple policies at a time

Expiration (to delete a parameter)

```
{
    "Type":"Expiration",
    "Version":"1.0",
    "Attributes":{
        "Timestamp":"2020-12-02T21:34:33.000Z"
    }
}
```

ExpirationNotification (EventBridge)

```
{
    "Type":"ExpirationNotification",
    "Version":"1.0",
    "Attributes":{
        "Before":"15",
        "Unit":"Days"
    }
}
```

NoChangeNotification (EventBridge)

```
{
    "Type":"NoChangeNotification",
    "Version":"1.0",
    "Attributes":{
        "After":"20",
        "Unit":"Days"
    }
}
```

SSM – Inventory
- Collect metadata from your managed instances (EC2/On-premises)
- Metadata includes installed software, OS drivers, configurations, installed updates, running services …
- View data in AWS Console or store in S3 and query and analyze using Athena and QuickSight
- Specify metadata collection interval (minutes, hours, days)
- Query data from multiple AWS accounts and regions
- Create Custom Inventory for your custom metadata (e.g., rack location of each managed instance)

SSM – State Manager

- Automate the process of keeping your managed instances (EC2/On-premises) in a state that you define

- Use cases: bootstrap instances with software, patch OS/software updates on a schedule …

- **State Manager Association:**
  - Defines the state that you want to maintain to your managed instances
  - Example: port 22 must be closed, antivirus must be installed …
  - Specify a schedule when this configuration is applied

- Uses SSM Documents to create an Association (e.g., SSM Document to configure CW Agent)

SSM – Patch Manager

- Automates the process of patching managed instances
- OS updates, applications updates, security updates, …
- Supports both EC2 instances and on-premises servers
- Supports Linux, macOS, and Windows
- Patch on-demand or on a schedule using **Maintenance Windows**
- Scan instances and generate patch compliance report (missing patches)
- Patch compliance report can be sent to S3

SSM – Patch Manager

- Patch Baseline
  - Defines which patches should and shouldn't be installed on your instances
  - Ability to create custom Patch Baselines (specify approved/rejected patches)
  - Patches can be auto-approved within days of their release
  - By default, install only critical patches and patches related to security
- Patch Group
  - Associate a set of instances with a specific Patch Baseline
  - Example: create Patch Groups for different environments (dev, test, prod)
  - Instances should be defined with the tag key **Patch Group**
  - An instance can only be in one Patch Group
  - Patch Group can be registered with only one Patch Baseline

SSM – Patch Manager Patch Baselines

- Pre-Defined Patch Baseline
  - Managed by AWS for different Operating Systems (can't be modified)
  - **AWS-RunPatchBaseline (SSM Document)** – apply both operating system and application patches (Linux, macOS, Windows Server)

- Custom Patch Baseline
  - Create your own Patch Baseline and choose which patches to auto-approve
  - Operating System, allowed patches, rejected patches, …
  - Ability to specify custom and alternative patch repositories

SSM – Patch Manager

AWS Console

AWS SDK

Maintenance Windows

run Document
AWS-RunPatchBaseline

SSM – Maintenance Windows

- Defines a schedule for when to perform actions on your instances

- Example: OS patching, updating drivers, installing software, …

- Maintenance Window contains
  - Schedule
  - Duration
  - Set of registered instances
  - Set of registered tasks

SSM – Session Manager

- Allows you to start a secure shell on your EC2 and on-premises servers
- Access through AWS Console, AWS CLI, or Session Manager SDK
- **Does not need SSH access, bastion hosts, or SSH keys**
- Supports Linux, macOS, and Windows
- Log connections to your instances and executed commands
- Session log data can be sent to S3 or CloudWatch Logs
- CloudTrail can intercept **StartSession** events

EC2 Instance
(SSM Agent)

Execute commands

Session Manager

IAM Permissions
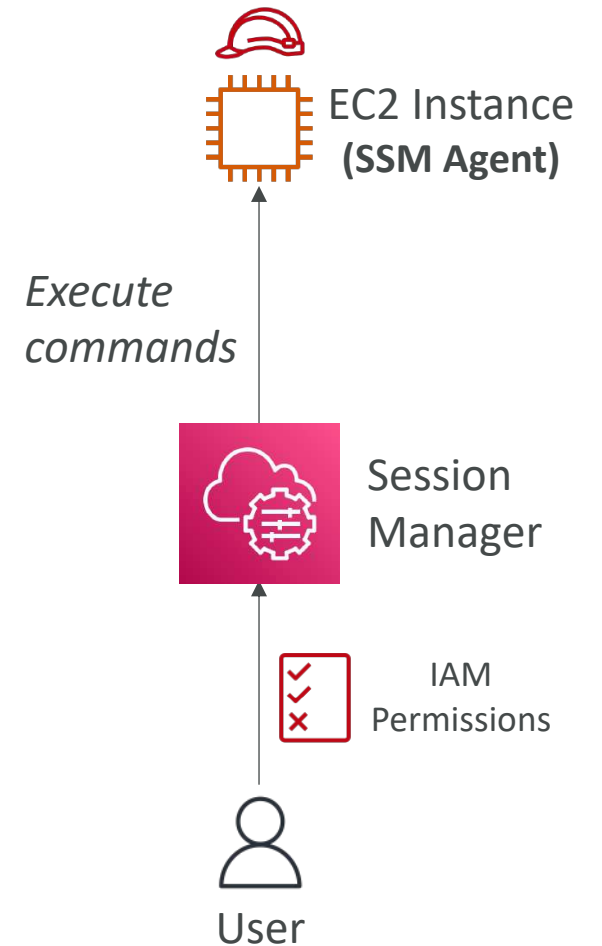

User

SSM – Session Manager

- IAM Permissions
  - Control which users/groups can access Session Manager and which instances
  - Use tags to restrict access to only specific EC2 instances
  - Access SSM + write to S3 + write to CloudWatch
- Optionally, you can restrict commands a user can run in a session

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ssm:StartSession",
            "Resource": "arn:aws:ec2:us-east-1:123456789012:instance/*",
            "Condition": {
                "StringLike": {
                    "ssm:resourceTag/Environment": ["Dev"]
                }
            }
        }
    ]
}
```

High Availability & Scalability

Load Balancer and Auto Scaling Groups

Scalability and High Availability Section

- Load Balancers:
  - Troubleshooting
  - Advanced options and logging
  - CloudWatch integrations

- Auto Scaling
  - Troubleshooting
  - Advanced options and logging
  - CloudWatch integrations

Scalability & High Availability

- Scalability means that an application / system can handle greater loads by adapting.

- There are two kinds of scalability:
  - Vertical Scalability
  - Horizontal Scalability (= elasticity)

- **Scalability is linked but different to High Availability**

- Let's deep dive into the distinction, using a call center as an example

Vertical Scalability

- Vertically scalability means increasing the size of the instance

- For example, your application runs on a t2.micro

- Scaling that application vertically means running it on a t2.large

- Vertical scalability is very common for non distributed systems, such as a database.

- RDS, ElastiCache are services that can scale vertically.

- There's usually a limit to how much you can vertically scale (hardware limit)
junior operator   senior operator

Horizontal Scalability

- Horizontal Scalability means increasing the number of instances / systems for your application

- Horizontal scaling implies distributed systems.

- This is very common for web applications / modern applications

- It's easy to horizontally scale thanks the cloud offerings such as Amazon EC2

operator   operator   operator

operator   operator   operator
High Availability

- High Availability usually goes hand in hand with horizontal scaling

- High availability means running your application / system in at least 2 data centers (== Availability Zones)

- The goal of high availability is to survive a data center loss

- The high availability can be passive (for RDS Multi AZ for example)

- The high availability can be active (for horizontal scaling)

first building in New York
second building in San Francisco
High Availability & Scalability For EC2

- Vertical Scaling: Increase instance size (= scale up / down)
    - From: t2.nano - 0.5G of RAM, 1 vCPU
    - To: u-12tb1.metal – 12.3 TB of RAM, 448 vCPUs

- Horizontal Scaling: Increase number of instances (= scale out / in)
    - Auto Scaling Group
    - Load Balancer

- High Availability: Run instances for the same application across multi-AZ
    - Auto Scaling Group multi-AZ
    - Load Balancer multi-AZ

What is load balancing?

- Load Balances are servers that forward traffic to multiple servers (e.g., EC2 instances) downstream
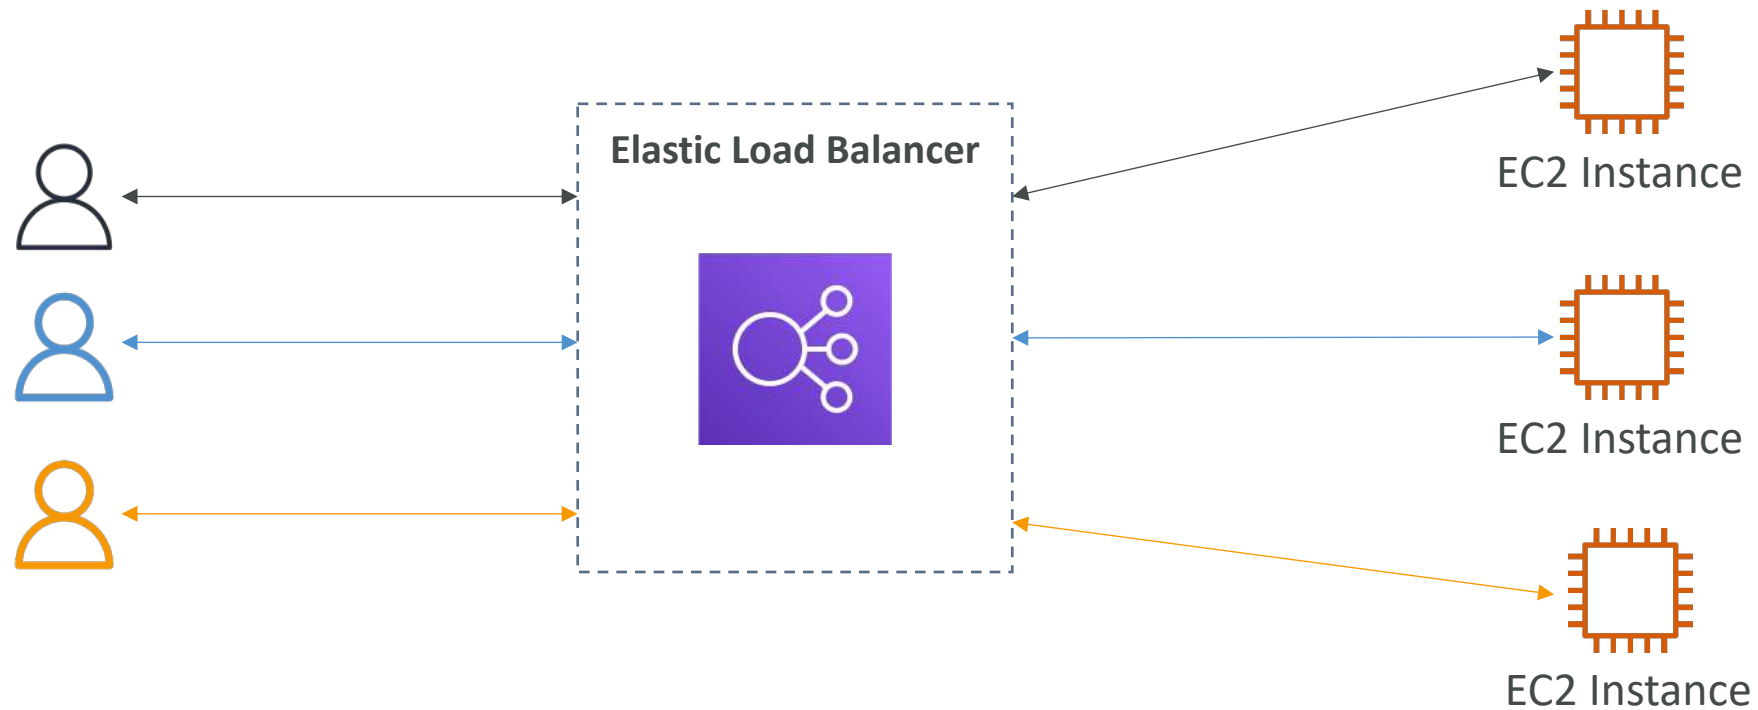

Why use a load balancer?

- Spread load across multiple downstream instances
- Expose a single point of access (DNS) to your application
- Seamlessly handle failures of downstream instances
- Do regular health checks to your instances
- Provide SSL termination (HTTPS) for your websites
- Enforce stickiness with cookies
- High availability across zones
- Separate public traffic from private traffic

Why use an Elastic Load Balancer?

- An Elastic Load Balancer is a managed load balancer
  - AWS guarantees that it will be working
  - AWS takes care of upgrades, maintenance, high availability
  - AWS provides only a few configuration knobs

- It costs less to setup your own load balancer but it will be a lot more effort on your end

- It is integrated with many AWS offerings / services
  - EC2, EC2 Auto Scaling Groups, Amazon ECS
  - AWS Certificate Manager (ACM), CloudWatch
  - Route 53, AWS WAF, AWS Global Accelerator

Health Checks

- Health Checks are crucial for Load Balancers

- They enable the load balancer to know if instances it forwards traffic to are available to reply to requests

- The health check is done on a port and a route (/health is common)

- If the response is not 200 (OK), then the instance is unhealthy

Health Checks

Protocol: HTTP
Port: 4567
Endpoint: /health

Elastic Load Balancer

EC2 Instance
Types of load balancer on AWS

- AWS has 4 kinds of managed Load Balancers
- **Classic Load Balancer** (v1 - old generation) – 2009 – CLB
  - HTTP, HTTPS, TCP, SSL (secure TCP)
- **Application Load Balancer** (v2 - new generation) – 2016 – ALB
  - HTTP, HTTPS, WebSocket
- **Network Load Balancer** (v2 - new generation) – 2017 – NLB
  - TCP, TLS (secure TCP), UDP
- **Gateway Load Balancer** – 2020 – GWLB
  - Operates at layer 3 (Network layer) – IP Protocol

- Overall, it is recommended to use the newer generation load balancers as they provide more features
- Some load balancers can be setup as internal (private) or external (public) ELBs

HTTP	TCP	80	sg-054b5ff5ea02f2b6e (load-b	Allow Traffic only...

Classic Load Balancers (v1)

- Supports TCP (Layer 4), HTTP & HTTPS (Layer 7)

- Health checks are TCP or HTTP based

- Fixed hostname XXX.region.elb.amazonaws.com

Client   listener   CLB   internal   EC2
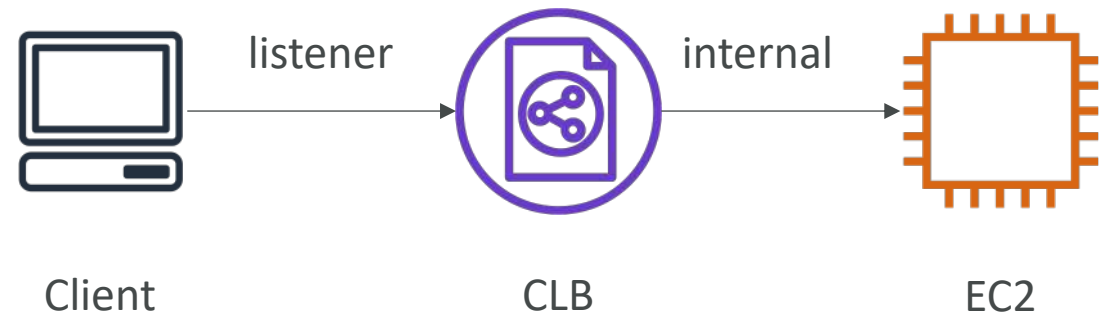

Application Load Balancer (v2)

- Application load balancers is Layer 7 (HTTP)

- Load balancing to multiple HTTP applications across machines (target groups)
- Load balancing to multiple applications on the same machine (ex: containers)
- Support for HTTP/2 and WebSocket
- Support redirects (from HTTP to HTTPS for example)
Application Load Balancer (v2)

- Routing tables to different target groups:
  - Routing based on path in URL   (example.com/users & example.com/posts)
  - Routing based on hostname in URL (one.example.com & other.example.com)
  - Routing based on Query String, Headers
    (example.com/users?id=123&order=false)

- ALB are a great fit for micro services & container-based application (example: Docker & Amazon ECS)

- Has a port mapping feature to redirect to a dynamic port in ECS

- In comparison, we'd need multiple Classic Load Balancer per application

Application Load Balancer (v2)
HTTP Based Traffic

WWW ← Route /user → External Application Load Balancer (v2)

External Application Load Balancer (v2)

WWW ← Route /search →

HTTP → Target Group for **Users** application — Health Check

HTTP → Target Group for **Search** application — Health Check
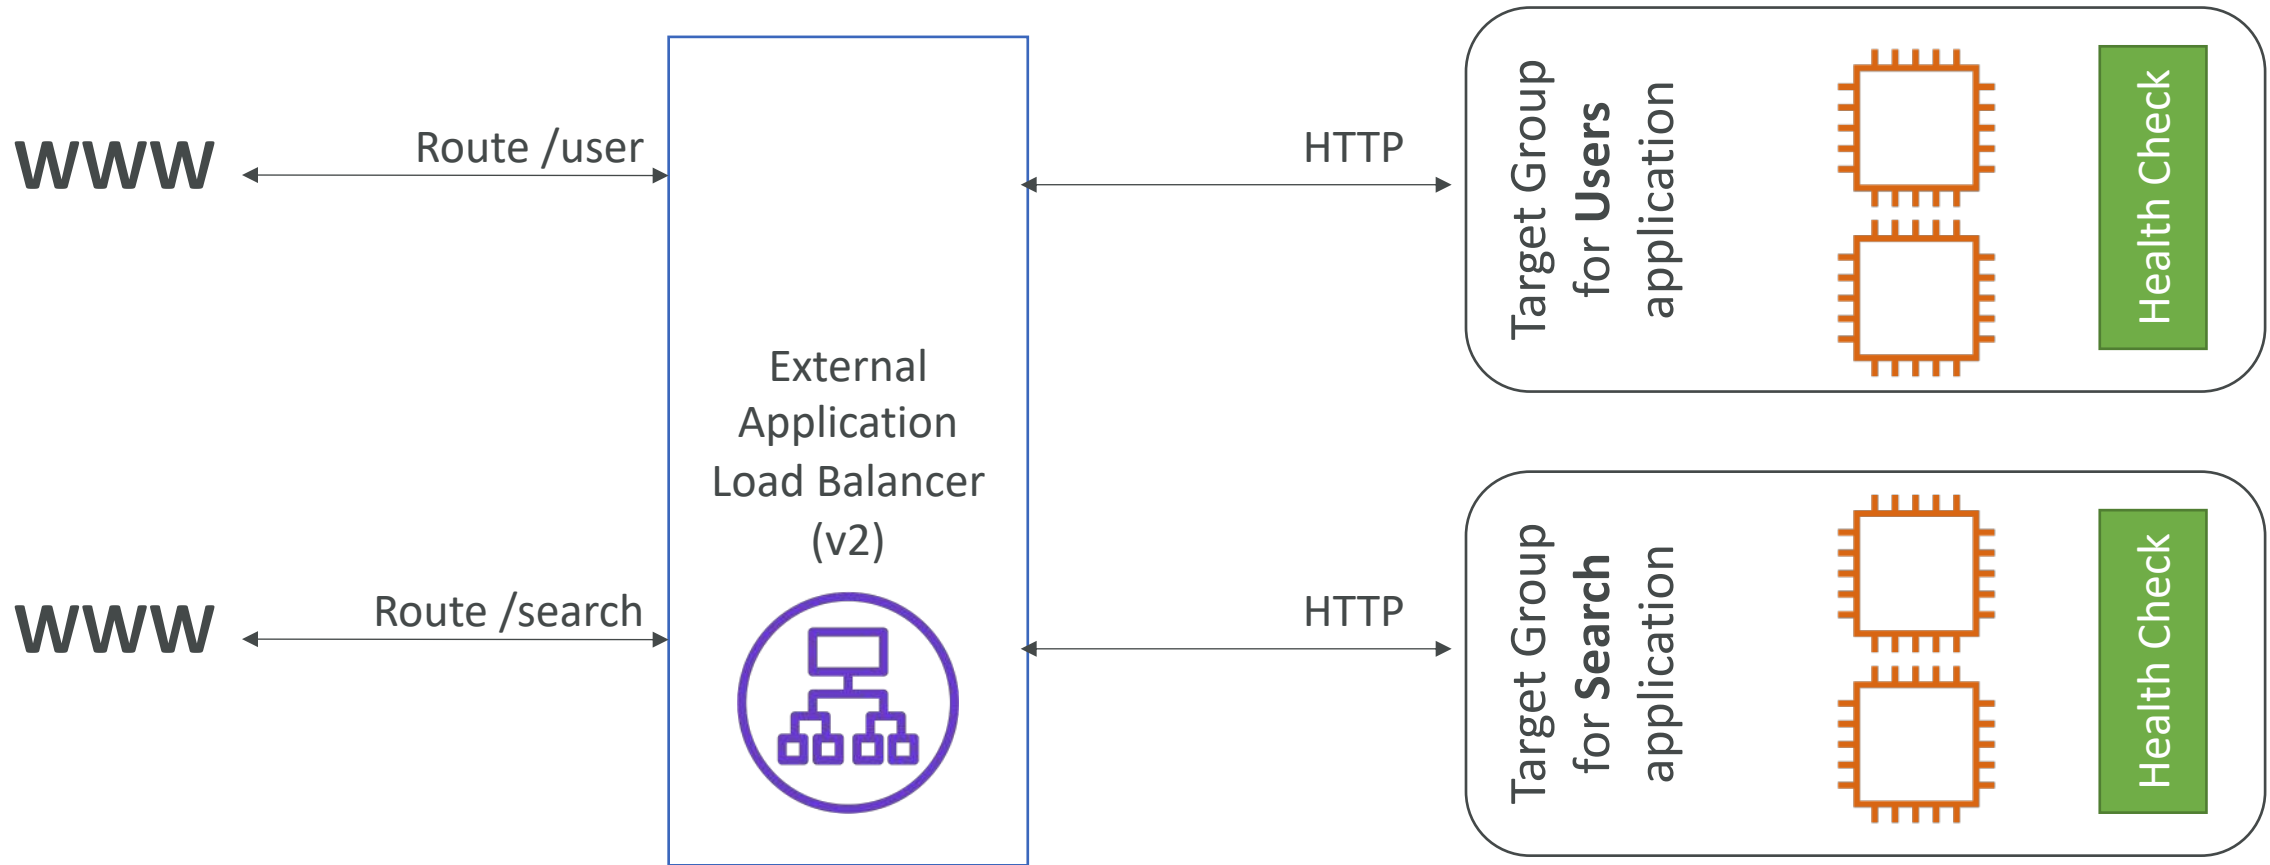

Application Load Balancer (v2)
Target Groups

- EC2 instances (can be managed by an Auto Scaling Group) – HTTP
- ECS tasks (managed by ECS itself) – HTTP
- Lambda functions – HTTP request is translated into a JSON event
- IP Addresses – must be private IPs

- ALB can route to multiple target groups
- Health checks are at the target group level

Application Load Balancer (v2)
Query Strings/Parameters Routing

Load Balancer
(v2)

?Platform=**Mobile**

Target Group 1
AWS – EC2 based

?Platform=**Desktop**

Target Group 2
On-premises – Private IP routing
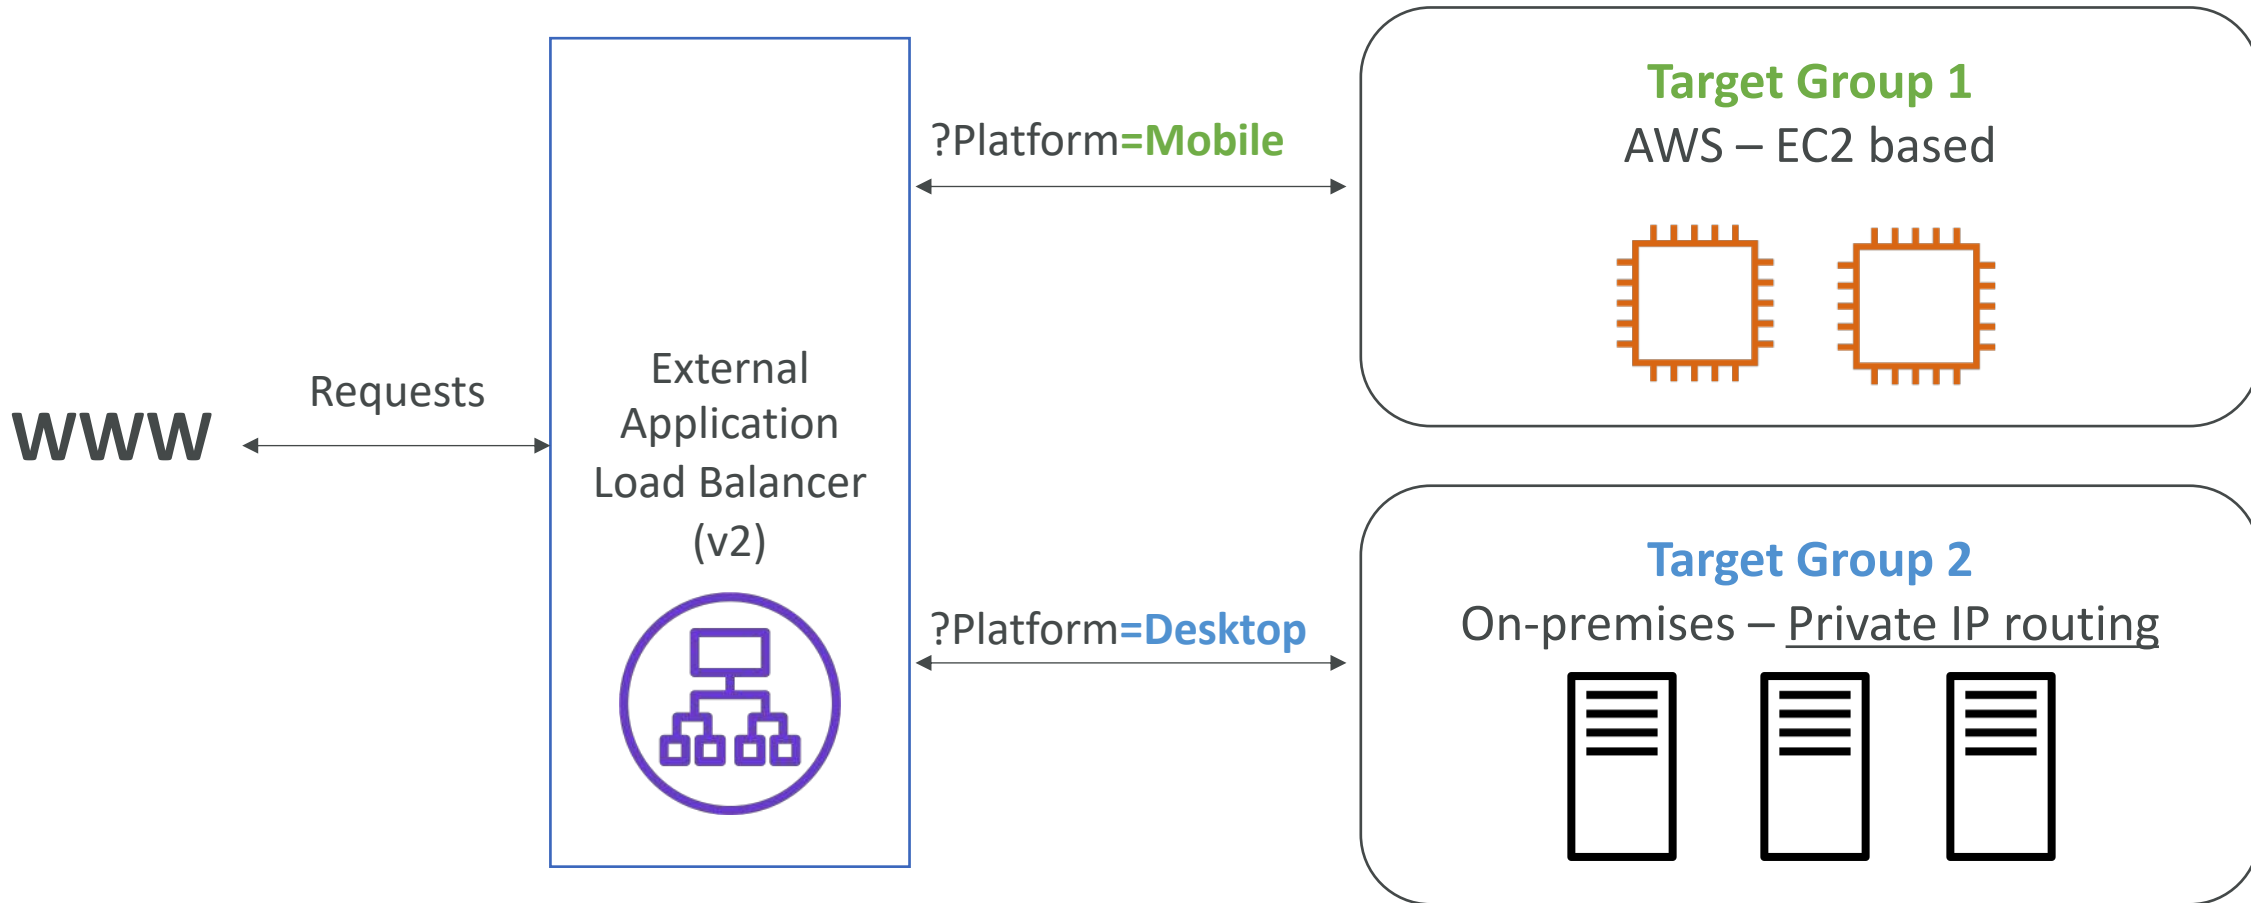

Application Load Balancer (v2)
Good to Know

- Fixed hostname (XXX.region.elb.amazonaws.com)
- The application servers don't see the IP of the client directly
  - The true IP of the client is inserted in the header **X-Forwarded-For**
  - We can also get Port (X-Forwarded-Port) and proto (X-Forwarded-Proto)

Client IP
12.34.56.78

Load Balancer IP
(Private IP)

EC2
Instance

Connection termination
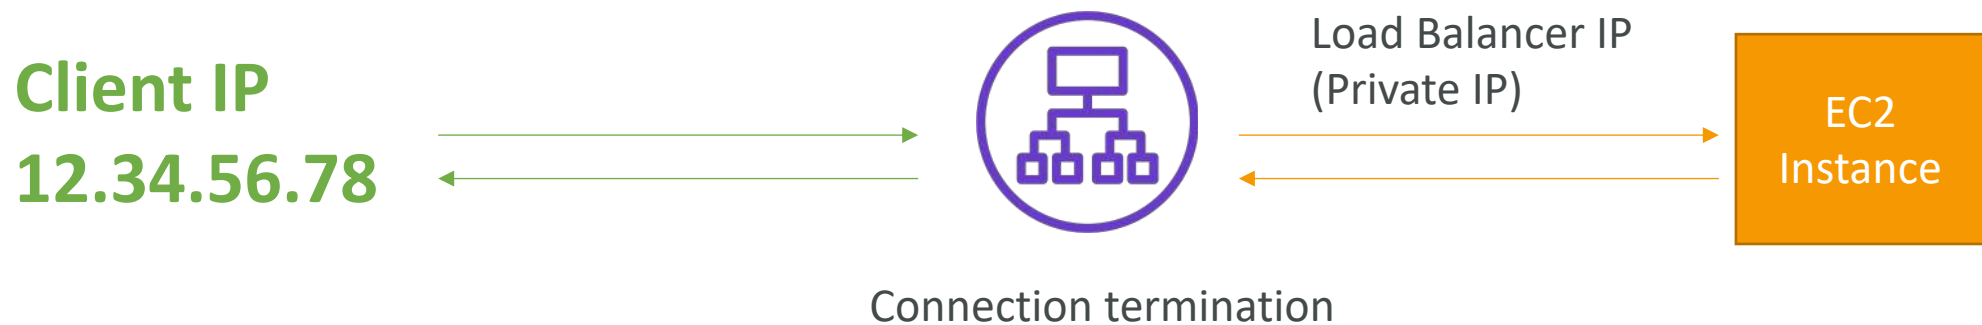

Network Load Balancer (v2)

- Network load balancers (Layer 4) allow to:
  - **Forward TCP & UDP traffic to your instances**
  - Handle millions of request per seconds
  - Ultra-low latency

- **NLB has <u>one static IP per AZ</u>, and supports assigning Elastic IP** (helpful for whitelisting specific IP)

- NLB are used for extreme performance, TCP or UDP traffic

- Not included in the AWS free tier

Network Load Balancer (v2)
TCP (Layer 4) Based Traffic

WWW ← TCP + Rules → External Network Load Balancer (v2)

← TCP → Target Group for **Users** application — Health Check

WWW ← TCP + Rules →

← HTTP → Target Group for **Search** application — Health Check
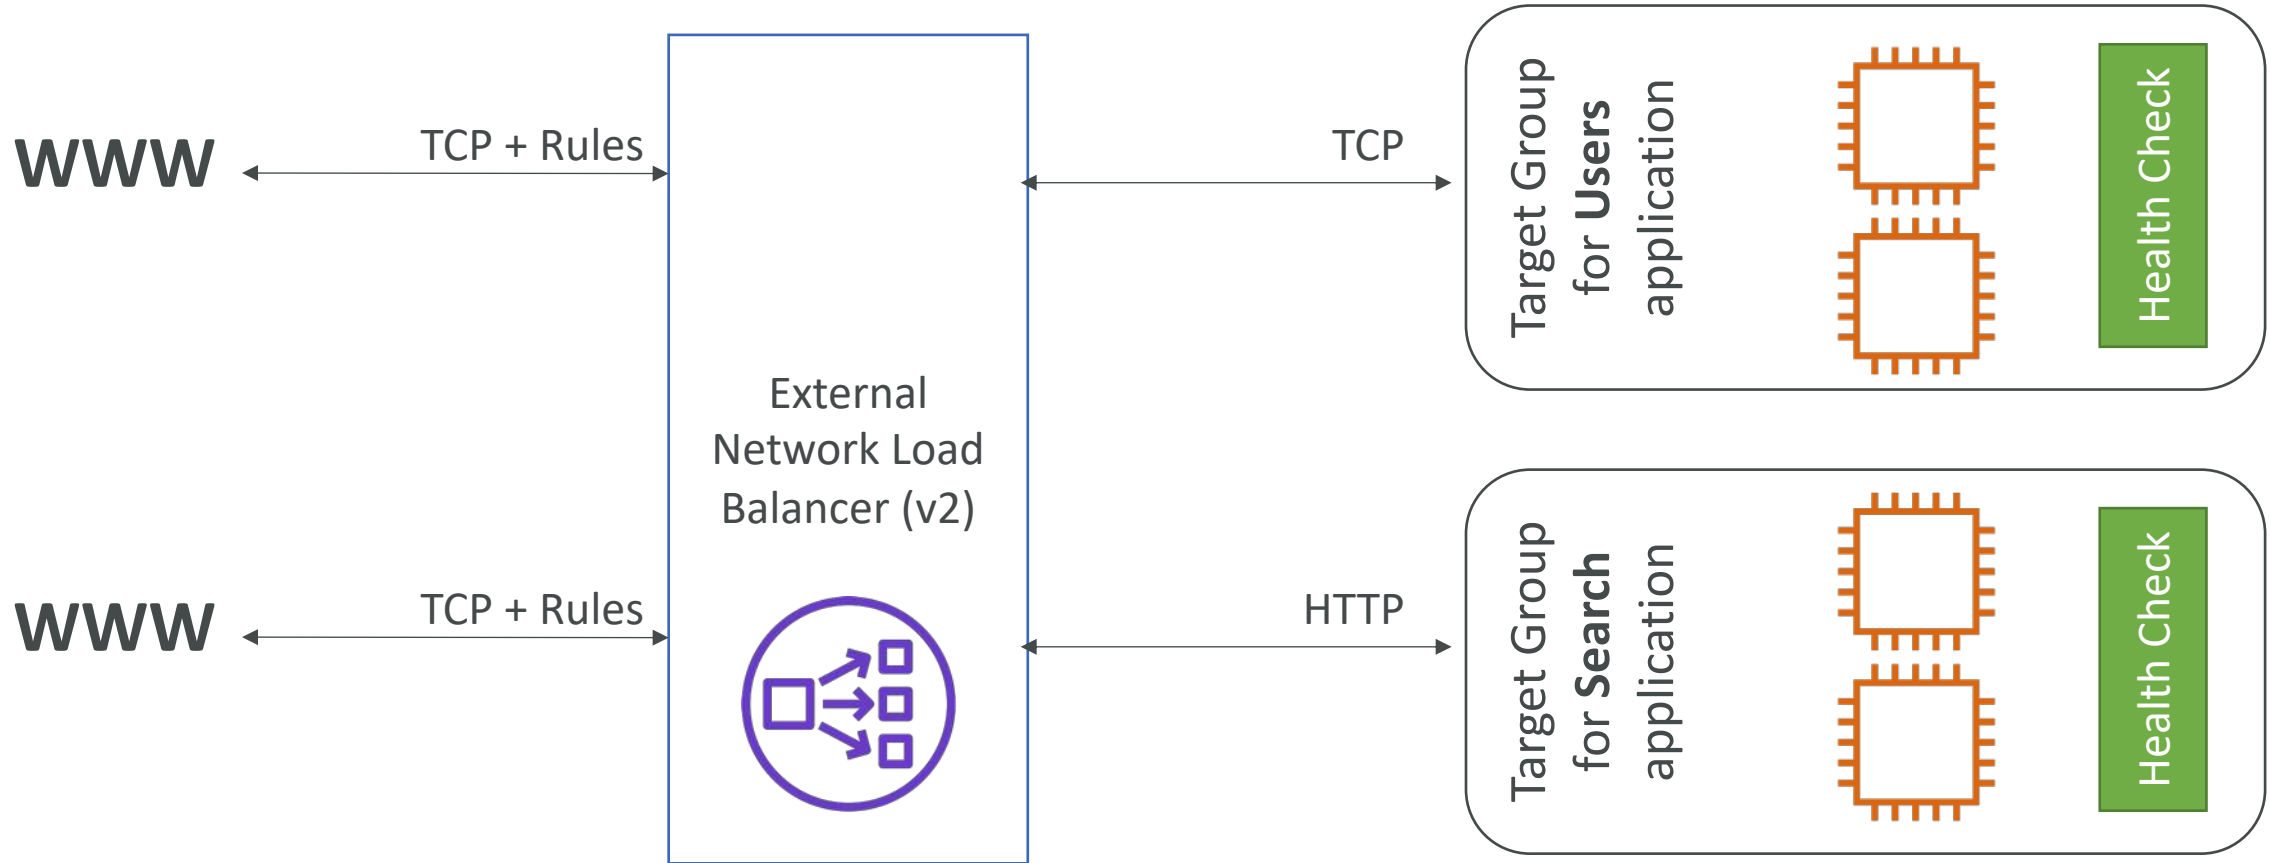

Network Load Balancer – Target Groups

- EC2 instances
- IP Addresses – must be private IPs
- Application Load Balancer
- Health Checks support the TCP, HTTP and HTTPS Protocols

Network Load Balancer

Target Group
(EC2 Instances)

Network Load Balancer

192.168.1.118 10.0.4.21

Target Group
(IP Addresses)

Network Load Balancer

Target Group
(Application Load Balancer)
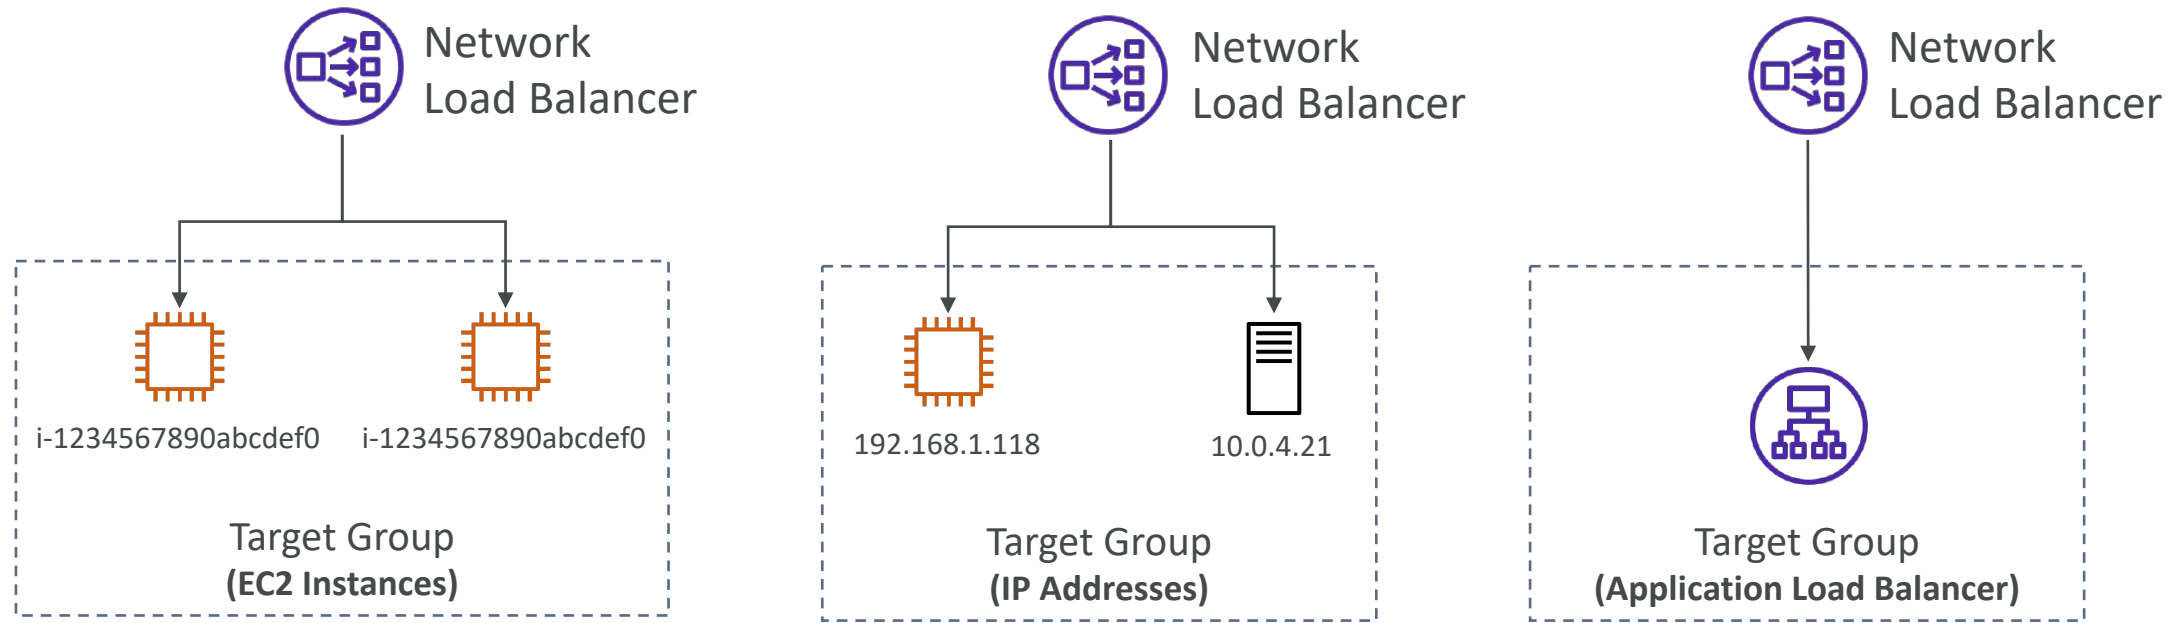

Gateway Load Balancer

- Deploy, scale, and manage a fleet of 3rd party network virtual appliances in AWS
- Example: Firewalls, Intrusion Detection and Prevention Systems, Deep Packet Inspection Systems, payload manipulation, …

- Operates at Layer 3 (Network Layer) – IP Packets
- Combines the following functions:
  - **Transparent Network Gateway** – single entry/exit for all traffic
  - **Load Balancer** – distributes traffic to your virtual appliances
- Uses the **GENEVE** protocol on port **6081**
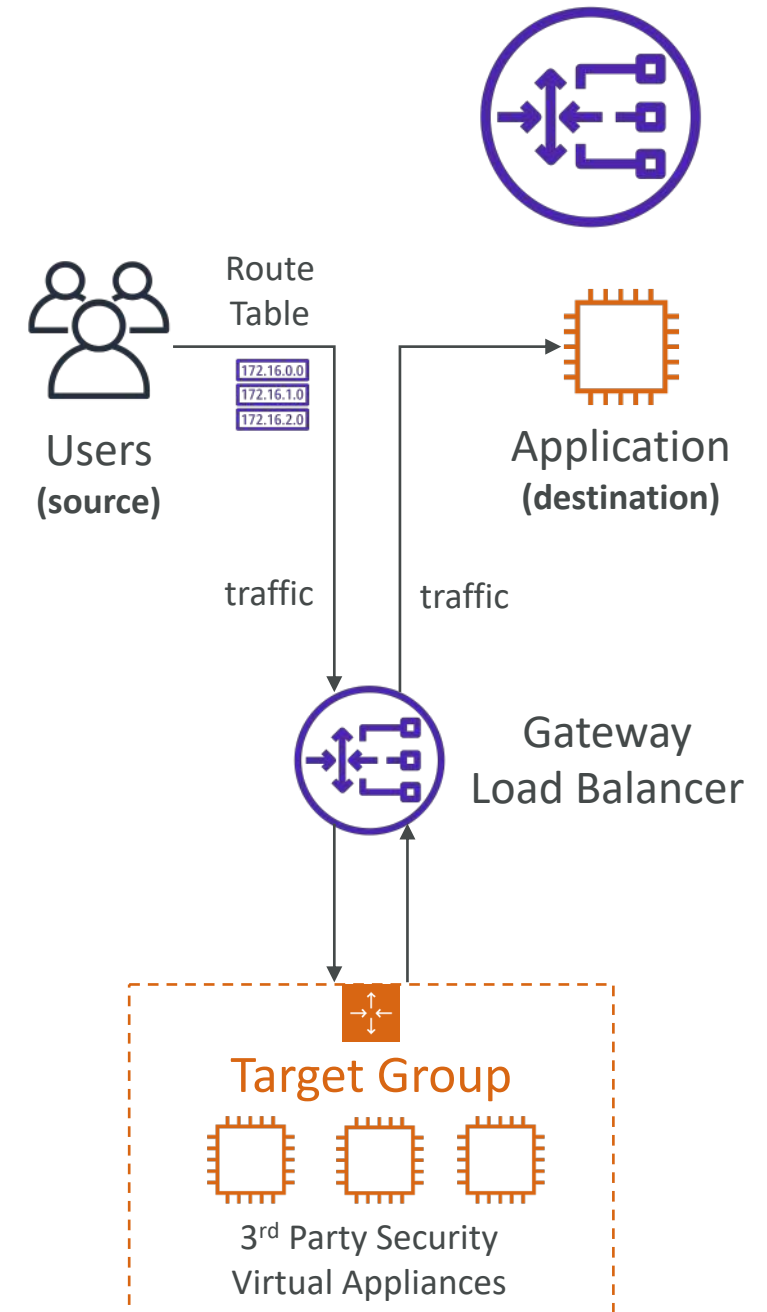

Users **(source)**

Target Group
(IP Addresses)
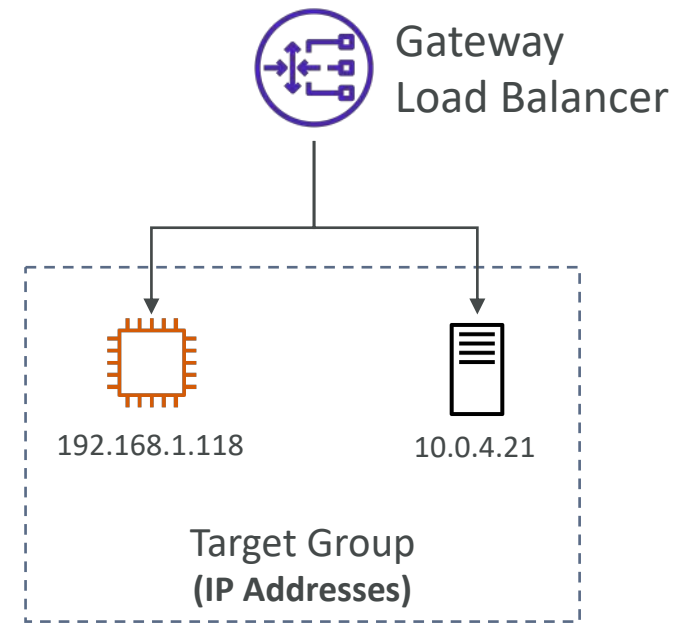

Sticky Sessions (Session Affinity)

- It is possible to implement stickiness so that the same client is always redirected to the same instance behind a load balancer

- This works for **Classic Load Balancer, Application Load Balancer, and Network Load Balancer**

- For both CLB & ALB, the "cookie" used for stickiness has an expiration date you control

- Use case: make sure the user doesn't lose his session data

- Enabling stickiness may bring imbalance to the load over the backend EC2 instances

Client 1   Client 2   Client 3

EC2 Instance   EC2 Instance
Sticky Sessions – Cookie Names

- Application-based Cookies
  - Custom cookie
    - Generated by the target
    - Can include any custom attributes required by the application
    - Cookie name must be specified individually for each target group
    - Don't use **AWSALB**, **AWSALBAPP**, or **AWSALBTG** (reserved for use by the ELB)
  - Application cookie
    - Generated by the load balancer
    - Cookie name is **AWSALBAPP**

- Duration-based Cookies
  - Cookie generated by the load balancer
  - Cookie name is **AWSALB** for ALB, **AWSELB** for CLB

Cross-Zone Load Balancing
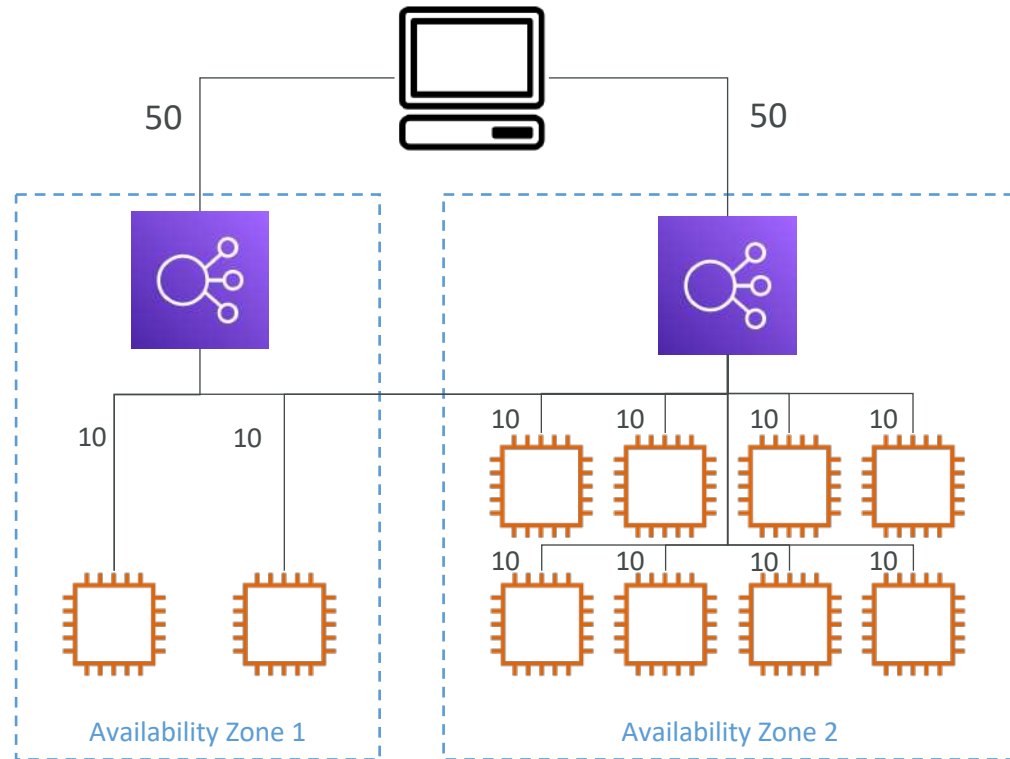

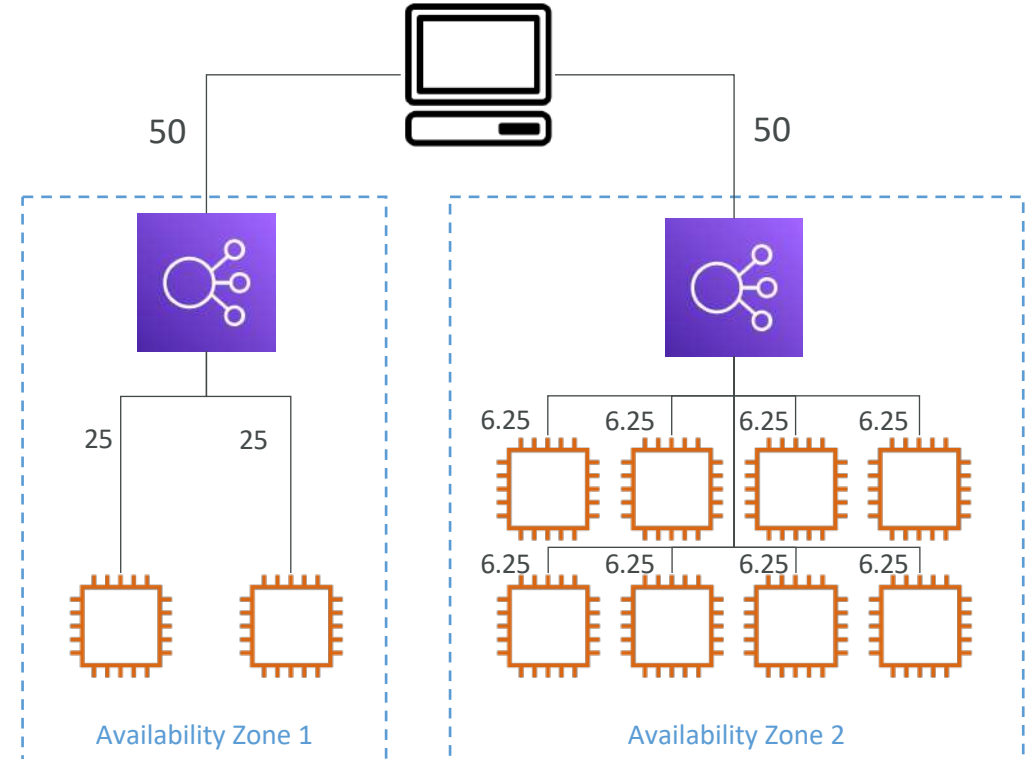

Cross-Zone Load Balancing

- Application Load Balancer
  - Enabled by default (can be disabled at the Target Group level)
  - No charges for inter AZ data

- Network Load Balancer & Gateway Load Balancer
  - Disabled by default
  - You pay charges ($) for inter AZ data if enabled

- Classic Load Balancer
  - Disabled by default
  - No charges for inter AZ data if enabled

SSL/TLS - Basics

- An SSL Certificate allows traffic between your clients and your load balancer to be encrypted in transit (in-flight encryption)

- **SSL** refers to Secure Sockets Layer, used to encrypt connections
- **TLS** refers to Transport Layer Security, which is a newer version
- Nowadays, **TLS certificates are mainly used**, but people still refer as SSL

- Public SSL certificates are issued by Certificate Authorities (CA)
- Comodo, Symantec, GoDaddy, GlobalSign, Digicert, Letsencrypt, etc…

- SSL certificates have an expiration date (you set) and must be renewed

Load Balancer - SSL Certificates

LOAD BALANCER

HTTPS (encrypted)
Over www

Users

HTTP
Over private VPC

EC2
Instance
- The load balancer uses an X.509 certificate (SSL/TLS server certificate)
- You can manage certificates using ACM (AWS Certificate Manager)
- You can create upload your own certificates alternatively
- HTTPS listener:
  - You must specify a default certificate
  - You can add an optional list of certs to support multiple domains
  - **Clients can use SNI (Server Name Indication) to specify the hostname they reach**
  - Ability to specify a security policy to support older versions of SSL / TLS (legacy clients)

SSL – Server Name Indication (SNI)

- SNI solves the problem of loading **multiple SSL certificates onto one web server** (to serve multiple websites)

- It's a "newer" protocol, and requires the client to **indicate** the hostname of the target server in the initial SSL handshake

- The server will then find the correct certificate, or return the default one

Note:

- Only works for ALB & NLB (newer generation), CloudFront

- Does not work for CLB (older gen)

Target group for www.mycorp.com

Target group for Domain1.example.com

I would like www.mycorp.com

Client

ALB

Use the correct SSL cert

SSL Cert: Domain1.example.com

SSL Cert: www.mycorp.com

....
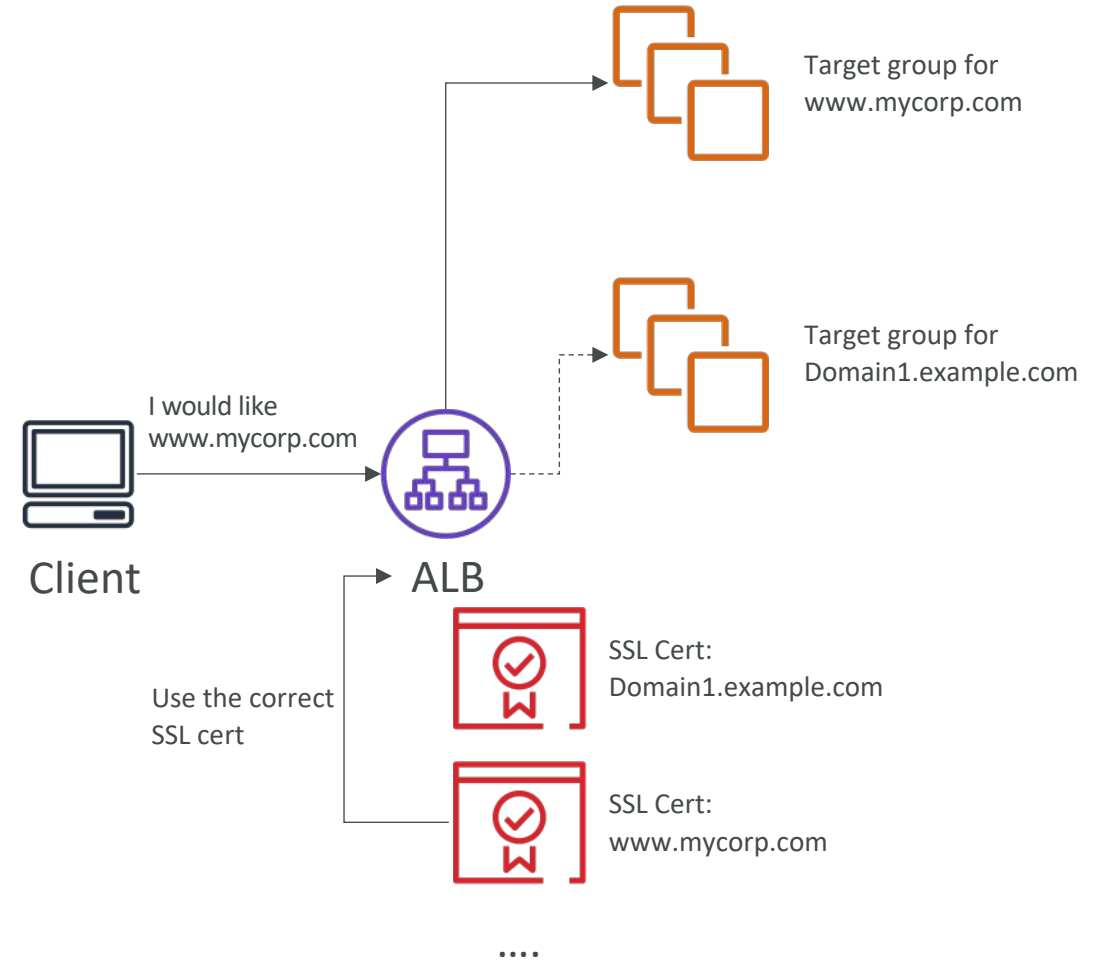

Elastic Load Balancers – SSL Certificates

- Classic Load Balancer (v1)
  - Support only one SSL certificate
  - Must use multiple CLB for multiple hostname with multiple SSL certificates

- Application Load Balancer (v2)
  - Supports multiple listeners with multiple SSL certificates
  - Uses Server Name Indication (SNI) to make it work

- Network Load Balancer (v2)
  - Supports multiple listeners with multiple SSL certificates
  - Uses Server Name Indication (SNI) to make it work

Connection Draining

- Feature naming
  - Connection Draining – for CLB
  - Deregistration Delay – for ALB & NLB

- Time to complete "in-flight requests" while the instance is de-registering or unhealthy

- Stops sending new requests to the EC2 instance which is de-registering

- Between 1 to 3600 seconds (default: 300 seconds)

- Can be disabled (set value to 0)

- Set to a low value if your requests are short

waiting for **existing** connections to complete

EC2 Instance
DRAINING

Users

ELB

EC2 Instance

new connections established to all other instances

EC2 Instance
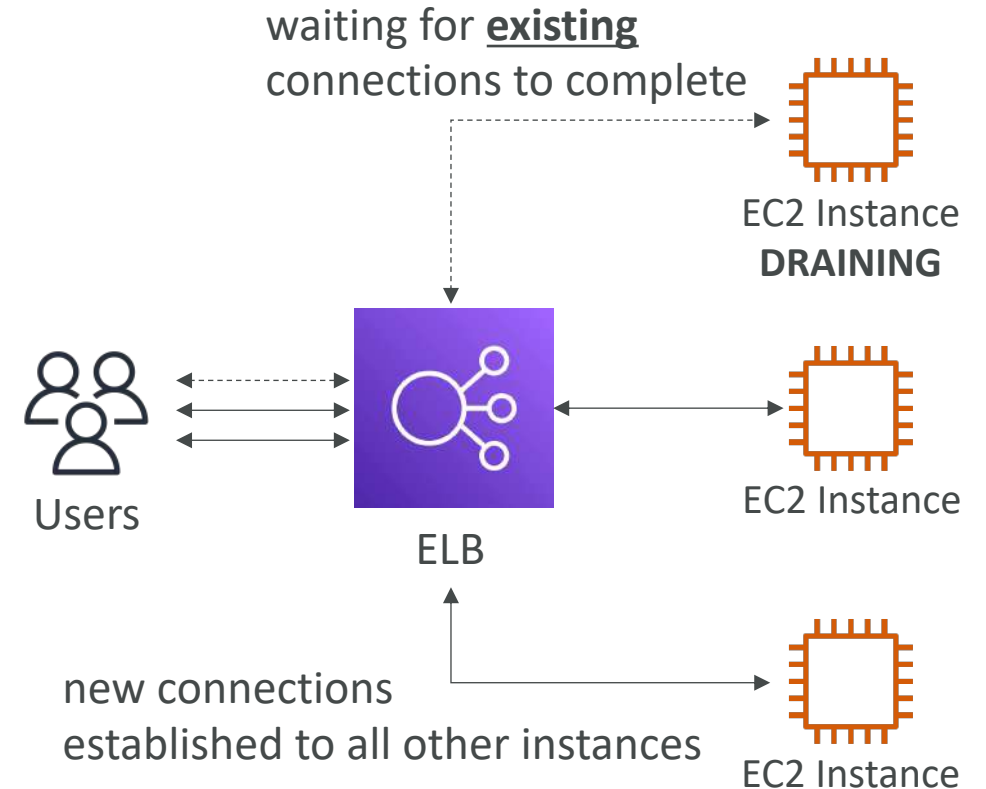

ELB Health Checks

- Target Health Status
  - **Initial:** registering the target
  - **Healthy**
  - **Unhealthy**
  - **Unused:** target is not registered
  - **Draining:** de-registering the target
  - **Unavailable:** health checks disabled

- **If a target group contains only unhealthy targets, ELB routes requests across its unhealthy targets**

Application
Load Balancer

❤️ Health Check

Setting	Value	Description
HealthCheckProtocol	HTTP	Protocol used to perform health checks
HealthCheckPort	80	Port used to perform health checks
HealthCheckPath	/	Destination for health checks on targets
HealthCheckTimeoutSeconds	5	Consider the health check failed if no response after 5 seconds
HealthCheckIntervalSeconds	30	Send health check every 30 seconds
HealthyThresholdCount	3	Consider the target healthy after 3 successful health checks
UnhealthyThresholdCount	5	Consider the target unhealthy after 5 failed health checks

Target Group
Load Balancer Error codes

- Successful request : Code 200.
- Unsuccessful at client side : 4XX code.
  - Error 400 : Bad Request
  - Error 401 : Unauthorized
  - Error 403 : Forbidden
  - Error 460 : Client closed connection.
  - Error 463 : X-Forwarded For header with >30 IP (Similar to malformed request).
- Unsuccessful at server side : 5xx code.
  - An error 500 / Internal server error would mean some error on the ELB itself.
  - Error 502 : Bad Gateway
  - **An error 503 / Service Unavailable**
  - Error 504 / Gateway timeout : probably an issue within the server.
  - Error 561 : Unauthorized

Load Balancers Monitoring

- All Load Balancer metrics are directly pushed to CloudWatch metrics

- BackendConnectionErrors
- HealthyHostCount / UnHealthyHostCount
- HTTPCode_Backend_2XX: Successful request.
- HTTPCode_Backend_3XX, redirected request
- **HTTPCode_ELB_4XX**: Client error codes
- **HTTPCode_ELB_5XX**: Server error codes generated by the load balancer.

- Latency
- RequestCount
- **RequestCountPerTarget**
- **SurgeQueueLength:** The total number of requests (HTTP listener) or connections (TCP listener) that are pending routing to a healthy instance. Help to scale out ASG. Max value is 1024
- **SpilloverCount:** The total number of requests that were rejected because the surge queue is full.

Application Load Balancer

HealthyHostCount: 4
UnHealthyHostCount: 2

Health Checks

Target Group 1   Target Group 2

www.datacumulus.com
Load Balancer troubleshooting using metrics

- **HTTP 400: BAD_REQUEST** => The client sent a malformed request that does not meet HTTP specifications.

- **HTTP 503: Service Unavailable** => Ensure that you have healthy instances in every Availability Zone that your load balancer is configured to respond in. Look for HealthyHostCount in CloudWatch

- **HTTP 504: Gateway Timeout** => Check if keep-alive settings on your EC2 instances are enabled and make sure that the keep-alive timeout is greater than the idle timeout settings of load balancer.

- Set alarms & look at the documentation for troubleshooting: https://docs.aws.amazon.com/elasticloadbalancing/latest/classic/ts-elb-error-message.html

Load Balancers Access Logs

- Access logs from Load Balancers can be stored in S3 and contain:
  - Time
  - Client IP address
  - Latencies
  - Request paths
  - Server response
  - Trace Id
- Only pay for the S3 storage
- Helpful for compliance reason
- Helpful for keeping access data even after ELB or EC2 instances are terminated
- Access Logs are already encrypted

Application Load Balancer Request Tracing

- Request tracing – Each HTTP request has an added custom header **'X-Amzn-Trace-Id'**

- Example:

X-Amzn-Trace-Id: Root=1-67891233-abcdef012345678912345678

- This is useful in logs / distributed tracing platform to track a single request

- Application Load Balancer is not (yet) integrated with X-Ray

Target Groups Settings

- **deregisteration_delay.timeout_seconds:** time the load balancer waits before deregistering a target
- **slow_start.duration_seconds:** (see next slide)
- **load_balancing.algorithm.type:** how the load balancer selects targets when routing requests (Round Robin, Least Outstanding Requests)
- **stickiness.enabled**
- **stickiness.type:** application-based or duration-based cookie
- **stickiness.app_cookie.cookie_name:** name of the application cookie
- **stickiness.app_cookie.duration_seconds:** application-based cookie expiration period
- **stickiness.lb_cookie.duration_seconds:** duration-based cookie expiration period

Slow Start Mode

- By default, a target receives its full share of requests once it's registered with the target group

- **Slow Start Mode** gives healthy targets time to warm-up before the load balancer sends them a full share of requests

- The load balancer linearly increases the number of requests that it sends to the target

- A target exits Slow Start Mode when:
  - The duration period elapses
  - The target becomes unhealthy

- To disable, set **Slow start duration** value to 0

Client

Slow Start duration

ALB

with Slow Start mode

without Slow Start mode

EC2 Instance

EC2 Instance

Target Group
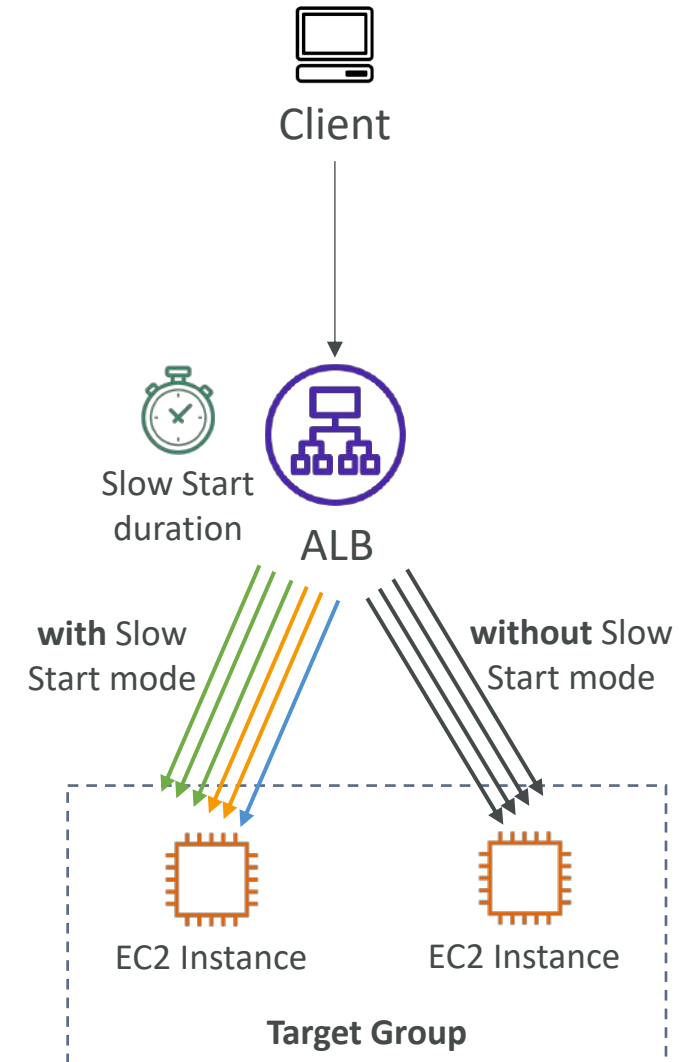

Request Routing Algorithms – Least Outstanding Requests

- The next instance to receive the request is the instance that has the lowest number of pending/unfinished requests
- Works with Application Load Balancer and Classic Load Balancer (HTTP/HTTPS)

ALB

CLB
(HTTP/HTTPS Listener)

EC2 Instance

EC2 Instance

EC2 Instance

Registered Instances

www.datacumulus.com
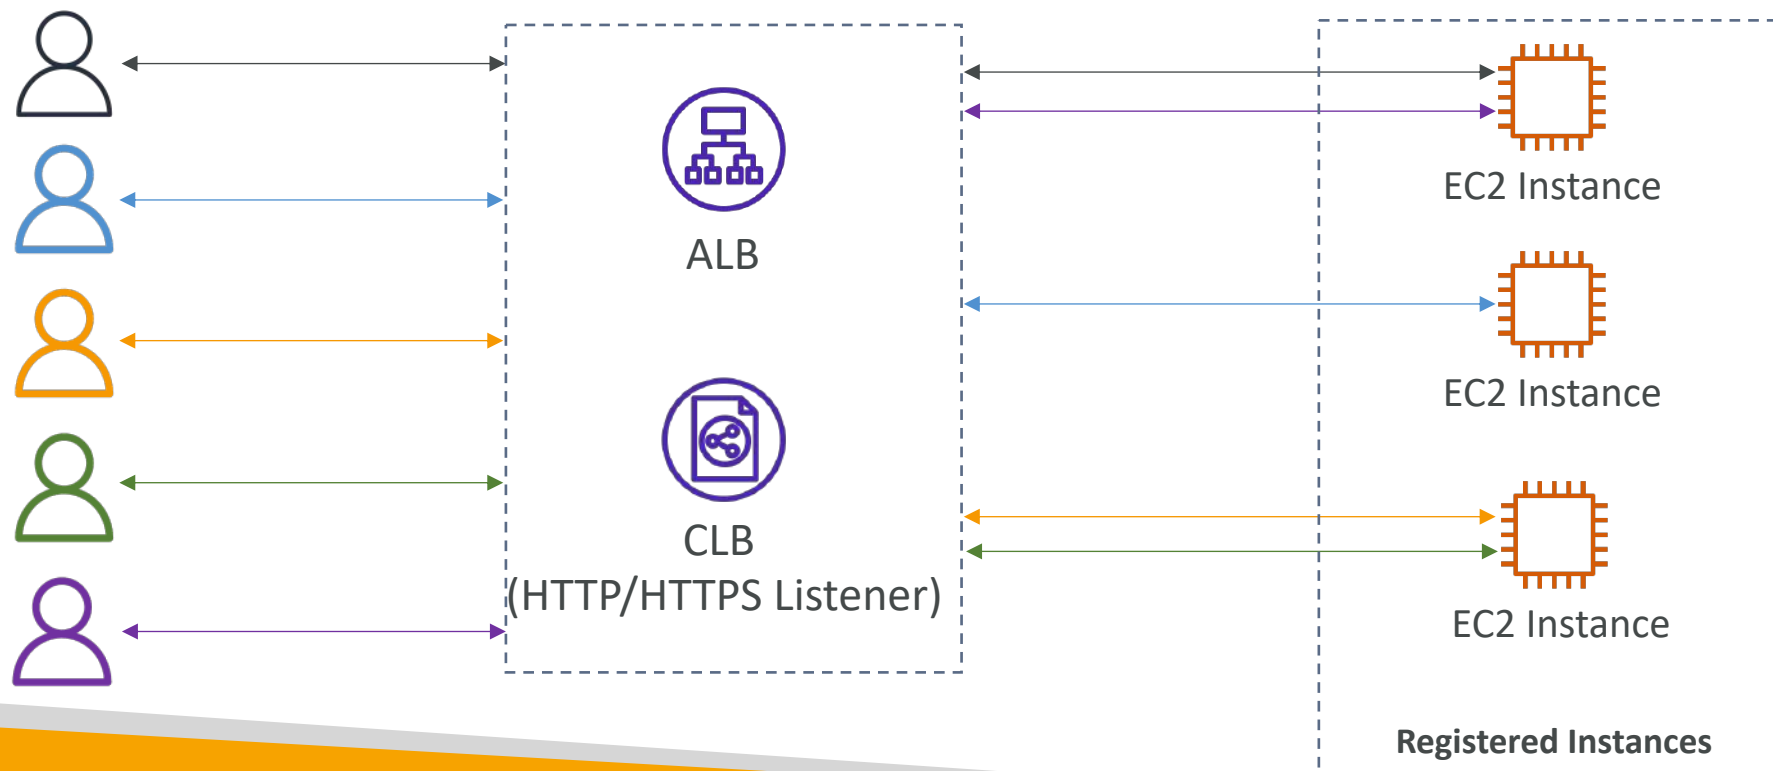

Request Routing Algorithms – Round Robin

- Equally choose the targets from the target group
- Works with **Application Load Balancer** and **Classic Load Balancer** **(TCP)**
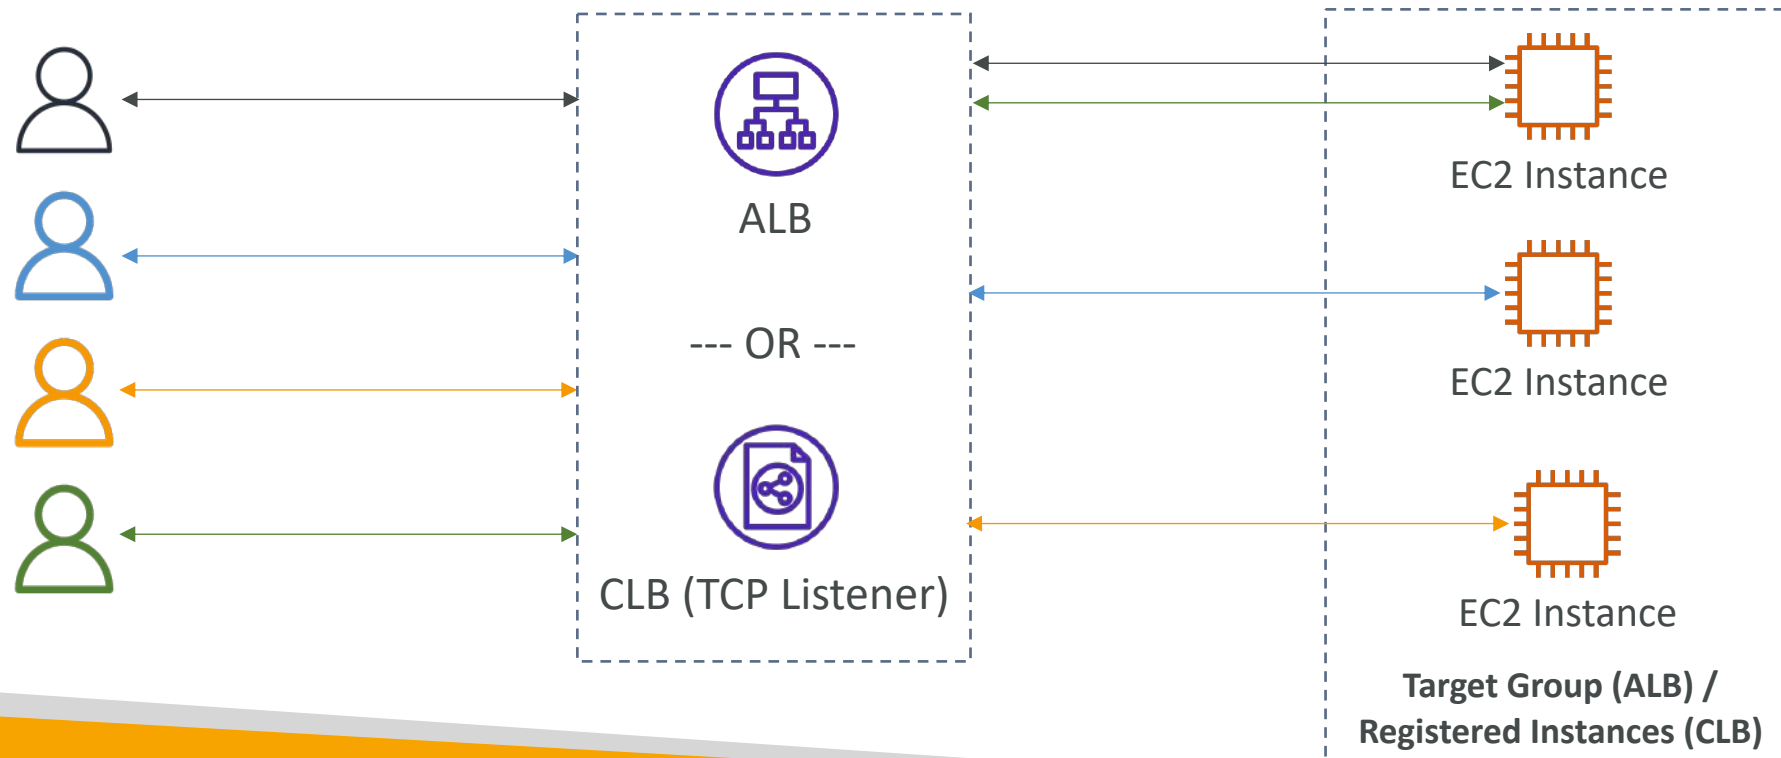

Request Routing Algorithms – Flow Hash

- Selects a target based on the protocol, source/destination IP address, source/destination port, and TCP sequence number
- Each TCP/UDP connection is routed to a single target for the life of the connection
- Works with **Network Load Balancer**
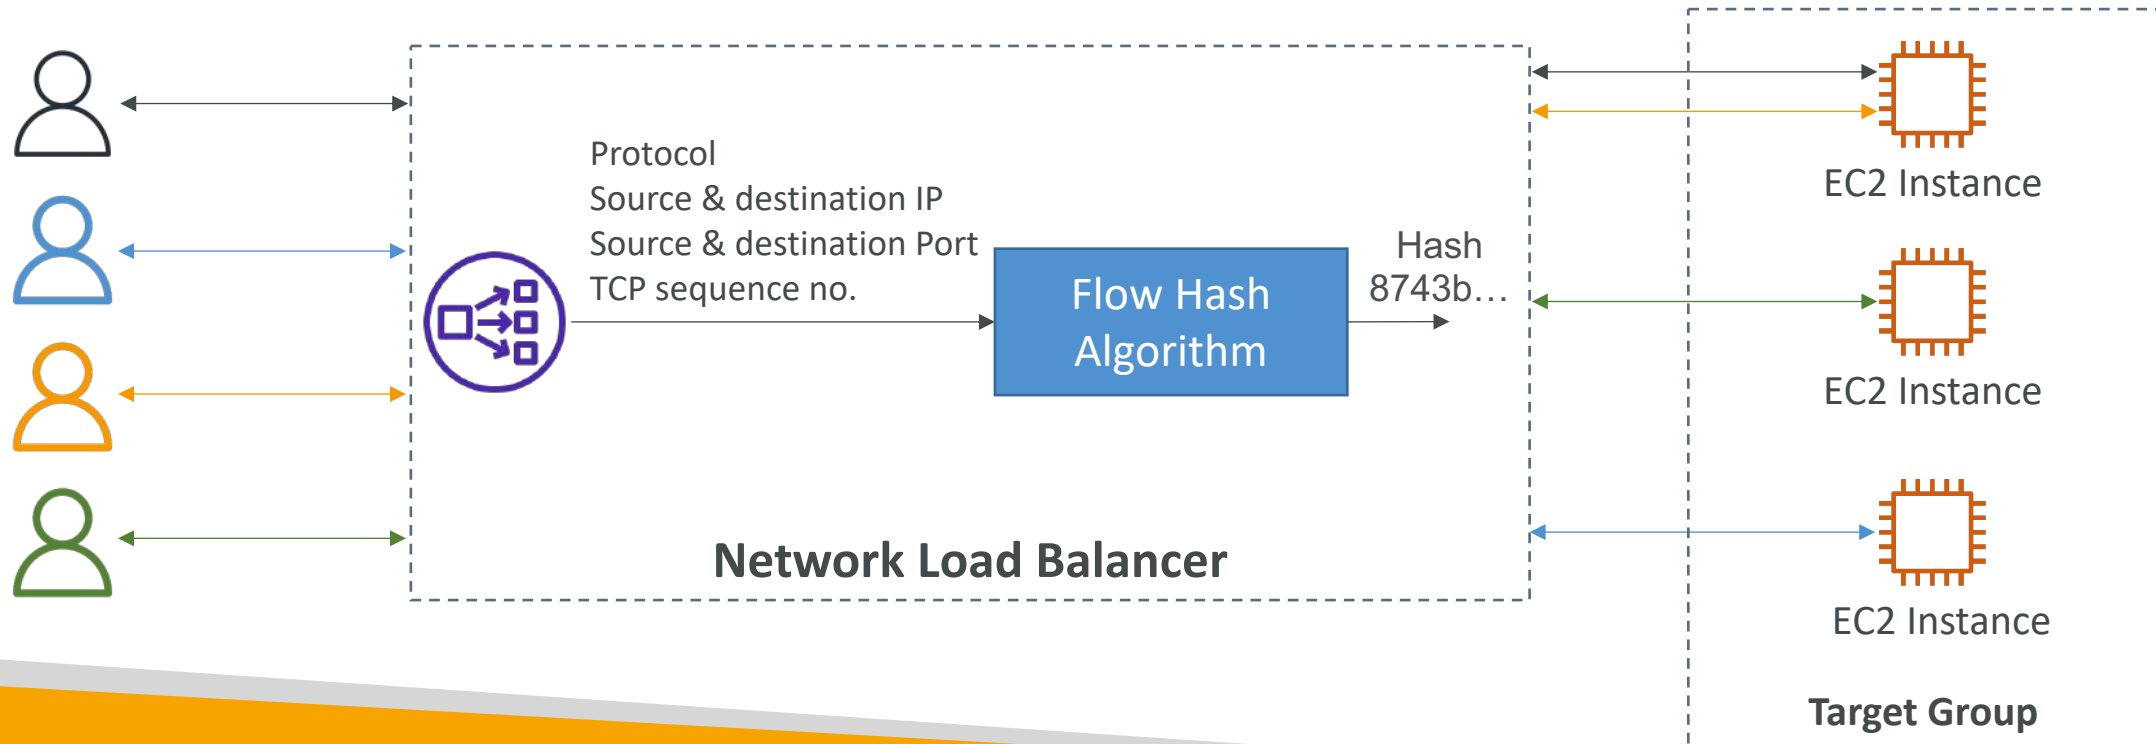

ALB – Listener Rules

- Processed in order (with Default Rule)
- Supported Actions (forward, redirect, fixed-response)
- Rule Conditions:
  - host-header
  - http-request-method
  - path-pattern
  - source-ip
  - http-header
  - query-string

Application Load Balancer

Listener

Rule #1

Rule #2

...

Rule (Default)

Target Group 1 (Blue)

Target Group 2 (Green)
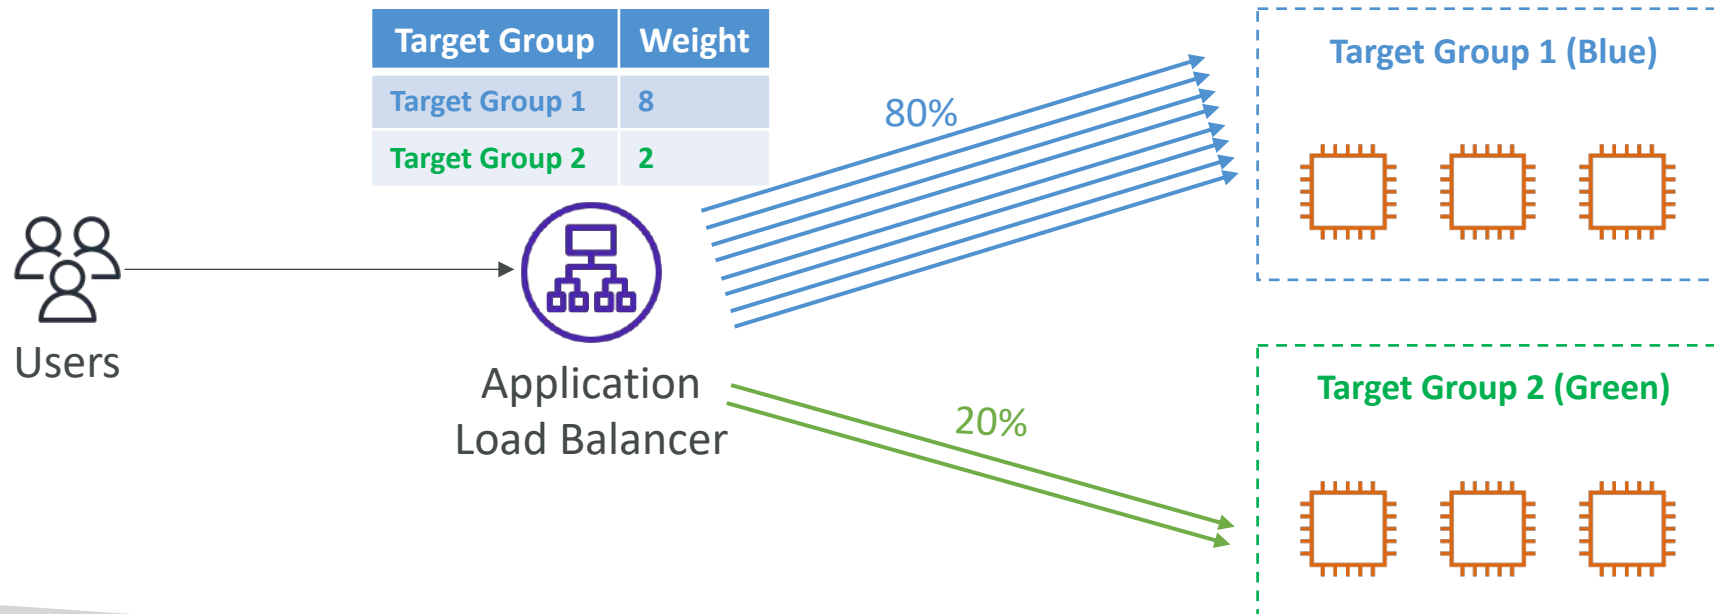

What's an Auto Scaling Group?

- In real-life, the load on your websites and application can change

- In the cloud, you can create and get rid of servers very quickly

- The goal of an Auto Scaling Group (ASG) is to:
  - Scale out (add EC2 instances) to match an increased load
  - Scale in (remove EC2 instances) to match a decreased load
  - Ensure we have a minimum and a maximum number of EC2 instances running
  - Automatically register new instances to a load balancer
  - Re-create an EC2 instance in case a previous one is terminated (ex: if unhealthy)

- ASG are free (you only pay for the underlying EC2 instances)

Auto Scaling Group Attributes

- A **Launch Template** (older "Launch Configurations" are deprecated)
  - AMI + Instance Type
  - EC2 User Data
  - EBS Volumes
  - Security Groups
  - SSH Key Pair
  - IAM Roles for your EC2 Instances
  - Network + Subnets Information
  - Load Balancer Information
- Min Size / Max Size / Initial Capacity
- Scaling Policies

ASG Launch Template

AMI — Instance Type — EBS Volumes

Security Groups — SSH Key Pair — IAM Role

VPC + Subnets — Load Balancer — ...
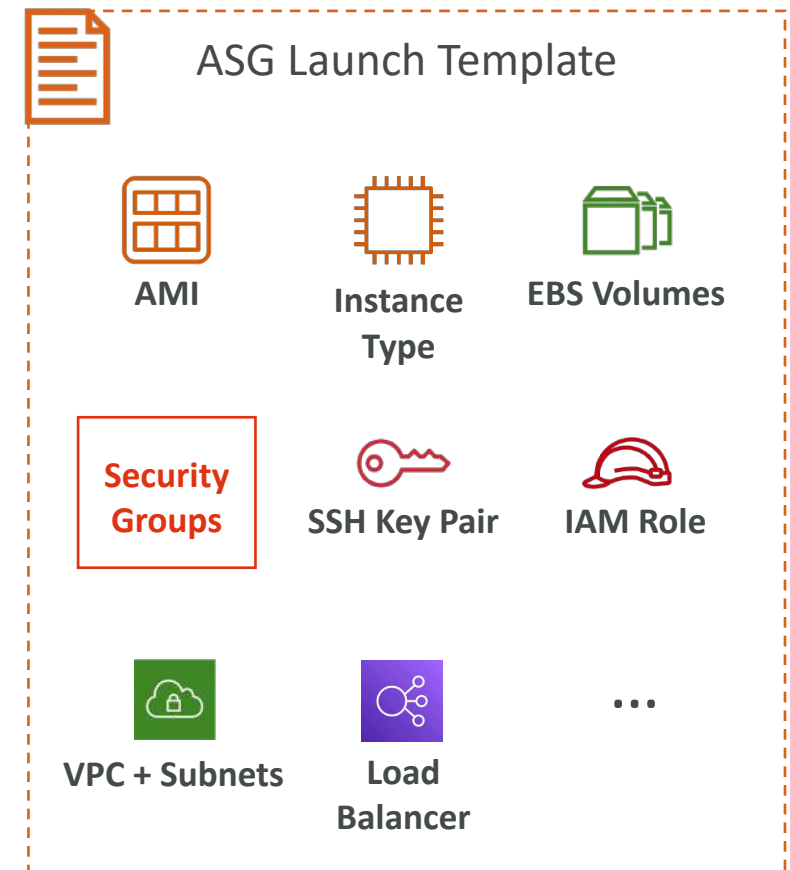

Auto Scaling - CloudWatch Alarms & Scaling

- It is possible to scale an ASG based on CloudWatch alarms

- An alarm monitors a metric (such as **Average CPU**, or a **custom metric**)

- Metrics such as Average CPU are computed for the overall ASG instances

- Based on the alarm:
  - We can create scale-out policies (increase the number of instances)
  - We can create scale-in policies (decrease the number of instances)

Auto Scaling Group

EC2 Instance   EC2 Instance   EC2 Instance   EC2 Instance   EC2 Instance

trigger Scaling
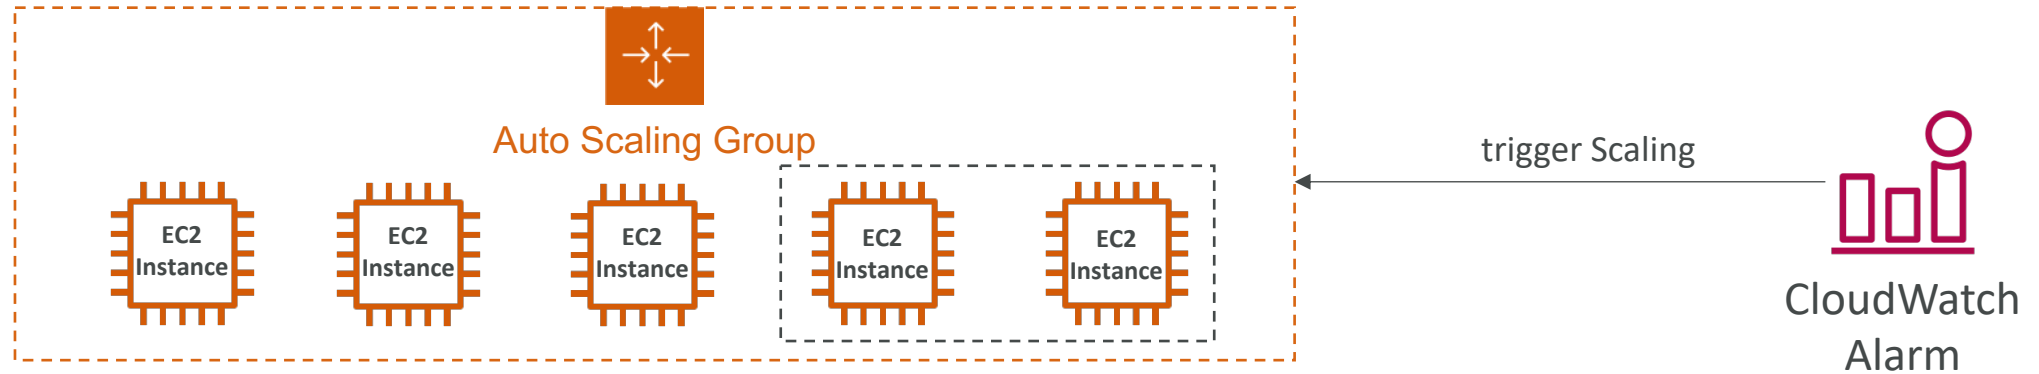

CloudWatch Alarm

Auto Scaling Groups – Scaling Policies

- Dynamic Scaling
  - Target Tracking Scaling
    - Simple to set-up
    - Example: I want the average ASG CPU to stay at around 40%
  - Simple / Step Scaling
    - When a CloudWatch alarm is triggered (example CPU > 70%), then add 2 units
    - When a CloudWatch alarm is triggered (example CPU < 30%), then remove 1

- Scheduled Scaling
  - Anticipate a scaling based on known usage patterns
  - Example: increase the min capacity to 10 at 5 pm on Fridays

Auto Scaling Groups – Scaling Policies

- **Predictive scaling:** continuously forecast load and schedule scaling ahead
Good metrics to scale on

- **CPUUtilization**: Average CPU utilization across your instances

- **RequestCountPerTarget**: to make sure the number of requests per EC2 instances is stable

- **Average Network In / Out** (if you're application is network bound)

- **Any custom metric** (that you push using CloudWatch)

Users

Application Load Balancer

RequestCountPerTarget
Target Value: 3
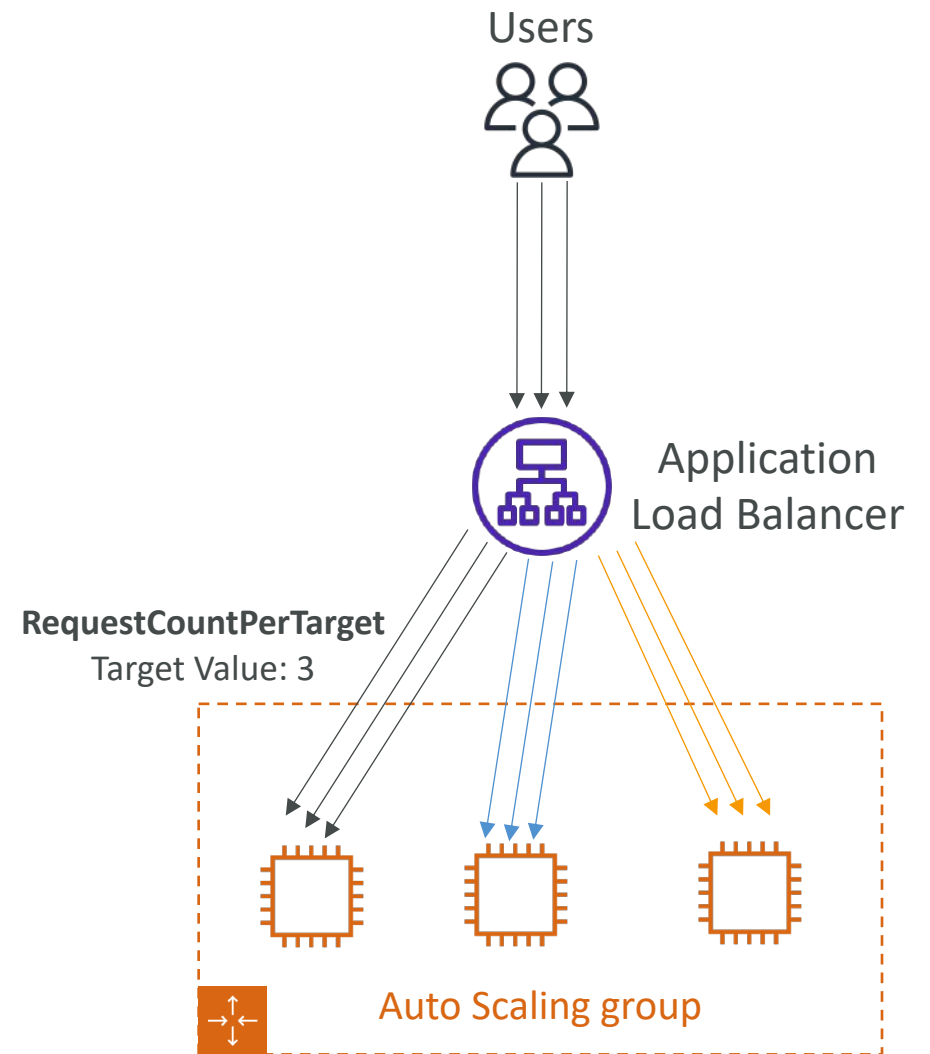

Auto Scaling group

Auto Scaling Groups - Scaling Cooldowns

- After a scaling activity happens, you are in the **cooldown period (default 300 seconds)**

- During the cooldown period, the ASG will not launch or terminate additional instances (to allow for metrics to stabilize)

- Advice: Use a ready-to-use AMI to reduce configuration time in order to be serving request fasters and reduce the cooldown period

```
Scaling Action Occurs
        |
        v
Default Cooldown in effect?
   |              |
  No             Yes
   |              |
   v              v
Launch or      Ignore Action
Teminate Instance
```
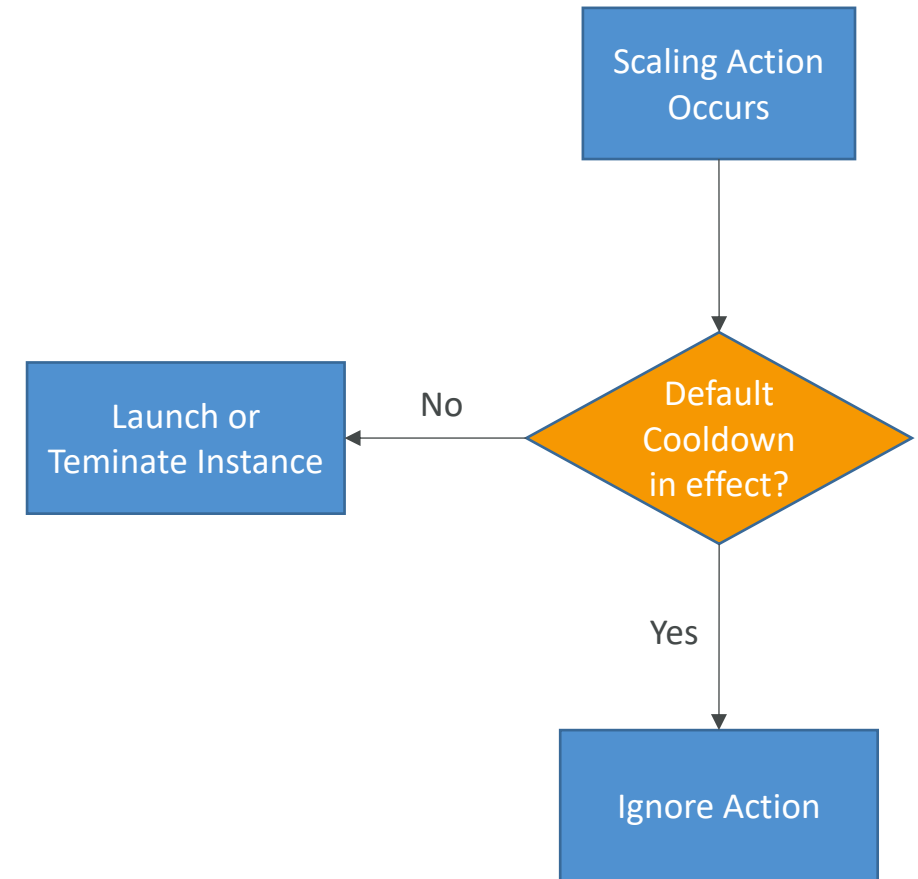

ASG – Lifecycle Hooks

- By default, as soon as an instance is launched in an ASG it's in service
- You can perform extra steps before the instance goes in service (Pending state)
  - Define a script to run on the instances as they start
- You can perform some actions before the instance is terminated (Terminating state)
  - Pause the instances before they're terminated for troubleshooting
- Use cases: cleanup, log extraction, special health checks
- Integration with EventBridge, SNS, and SQS
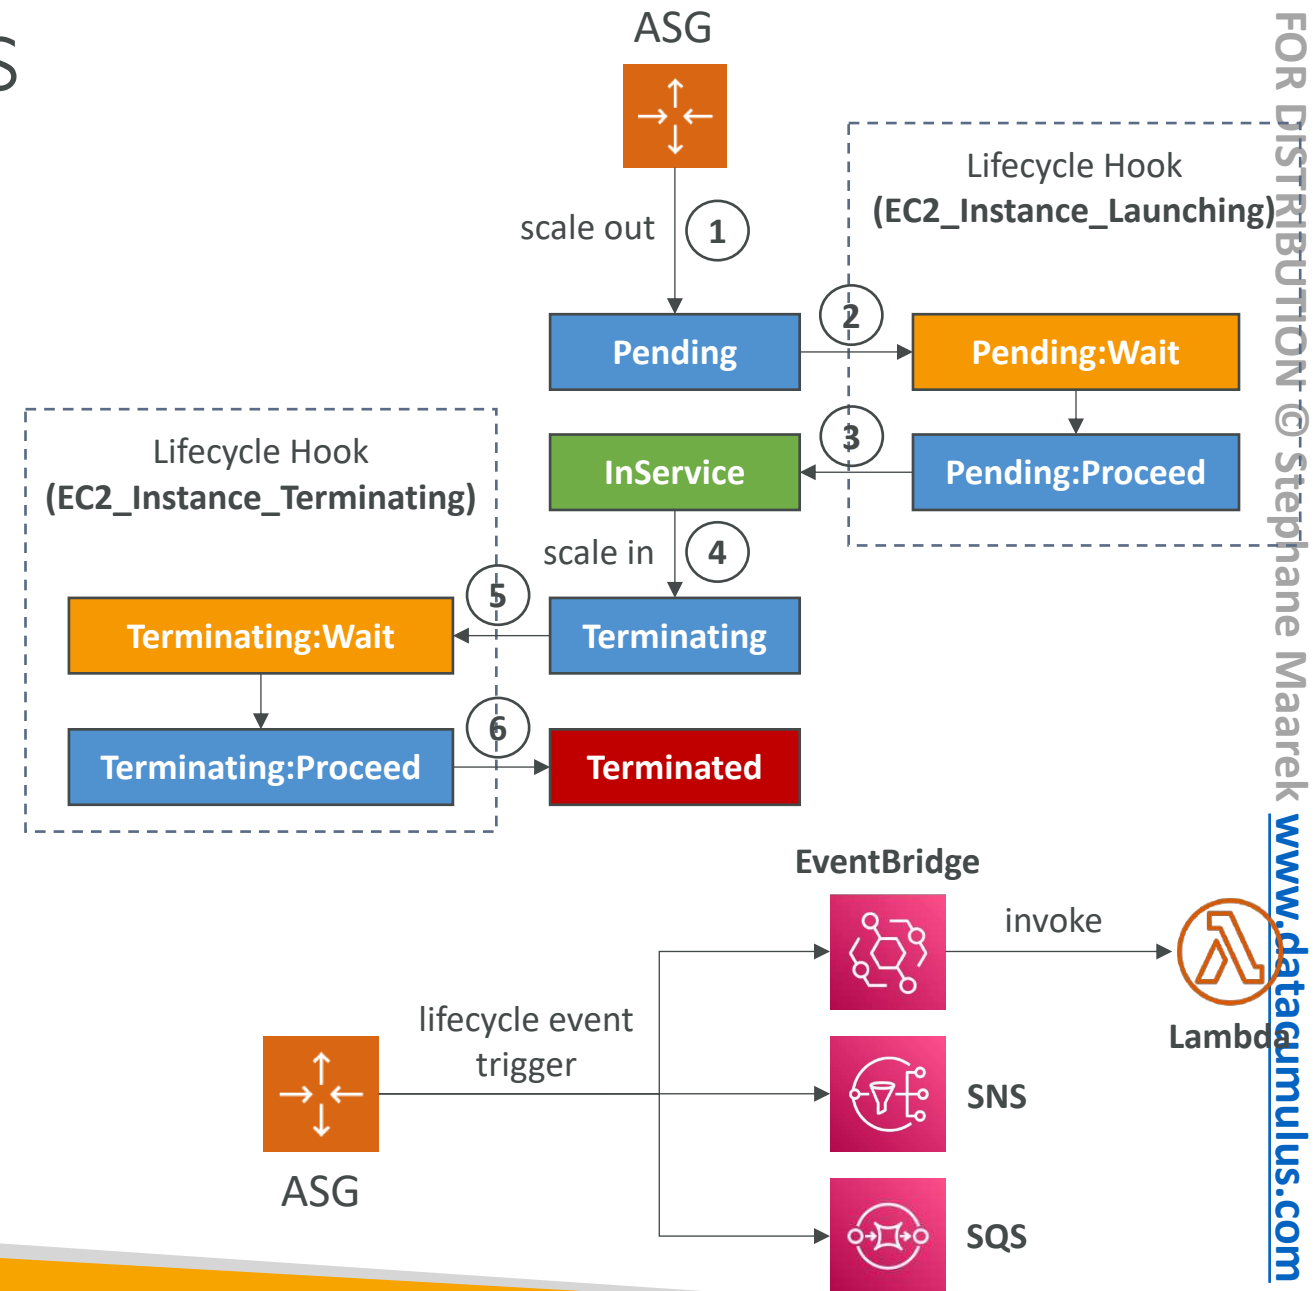

Launch Configuration vs. Launch Template

- Both:
    - ID of the Amazon Machine Image (AMI), the instance type, a key pair, security groups, and the other parameters that you use to launch EC2 instances (tags, EC2 user-data...)
    - You can't edit both Launch Configurations and Launch Templates

- Launch Configuration (legacy):
    - Must be re-created every time

- Launch Template (newer):
    - Can have multiple versions
    - Create parameters subsets (partial configuration for re-use and inheritance)
    - Provision using both On-Demand and Spot instances (or a mix)
    - Supports Placement Groups, Capacity Reservations, Dedicated hosts, multiple instance types
    - Can use T2 unlimited burst feature
    - Recommended by AWS going forward

SQS with Auto Scaling Group (ASG)

SQS Queue → Poll for messages → **EC2 Instances**

Auto Scaling Group

CloudWatch Metric – Queue Length
ApproximateNumberOfMessages

Alarm for breach →

CloudWatch Alarm

scale
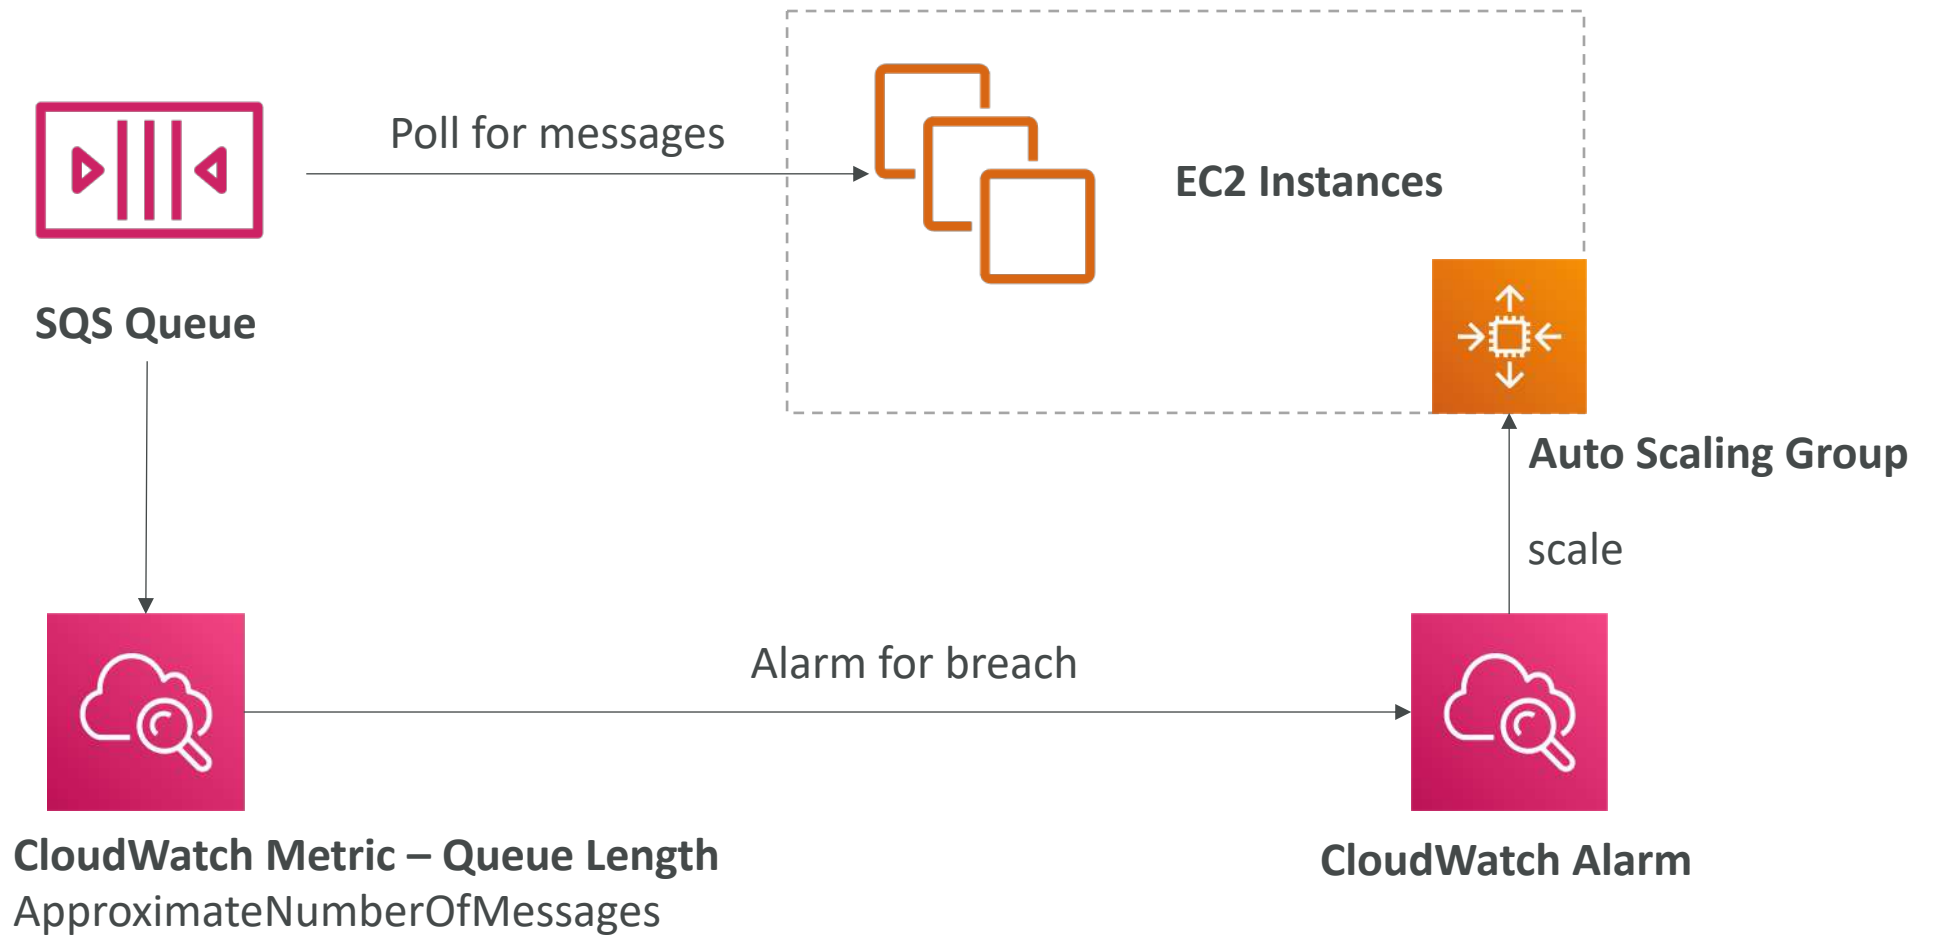

ASG Health Checks

- To make sure you have high availability, means you have least 2 instances running across 2 AZ in your ASG (must configure multi-AZ ASG)

- Health checks available:
  - **EC2 Status Checks**
  - **ELB Health Checks**
  - **Custom Health Checks:** send instance's health to ASG using AWS CLI or AWS SDK

- ASG will launch a new instance after terminating an unhealthy one

- ASG will not reboot unhealthy hosts for you

- Good to know CLI:
  - set-instance-health (use with Custom Health Checks)
  - terminate-instance-in-auto-scaling-group

Troubleshooting ASG issues

- <number of instances> instance(s) are already running. Launching EC2 instance failed.
    - The Auto Scaling group has reached the limit set by the MaximumCapacity parameter. Update your Auto Scaling group by providing a new value for the maximum capacity.

- Launching EC2 instances is failing:
    - The security group does not exist. SG might have been deleted
    - The key pair does not exist. The key pair might have been deleted

- If the ASG fails to launch an instance for over 24 hours, it will automatically suspend the processes (administration suspension)

CloudWatch Metrics for ASG

- Metrics are collected every 1 minute

- ASG-level metrics: (opt-in)
  - GroupMinSize, GroupMaxSize, GroupDesiredCapacity
  - GroupInServiceInstances, GroupPendingInstances, GroupStandbyInstances
  - GroupTerminatingInstances, GroupTotalInstances
  - You should enable metric collection to see these metrics

- EC2-level metrics (enabled): CPU Utilization, etc…
  - Basic monitoring: 5 minutes granularity
  - Detailed monitoring: 1 minute granularity

AWS Auto Scaling
- Backbone service of auto scaling for scalable resources in AWS:

- Amazon EC2 Auto Scaling groups: Launch or terminate EC2 instances

- Amazon EC2 Spot Fleet requests: Launch or terminate instances from a Spot Fleet request, or automatically replace instances that get interrupted for price or capacity reasons.

- Amazon ECS: Adjust the ECS service desired count up or down

- Amazon DynamoDB (table or global secondary index): WCU & RCU

- Amazon Aurora: Dynamic Read Replicas Auto Scaling

AWS Auto Scaling – Scaling Plans

- **Dynamic scaling:** creates a target tracking scaling policy
  - Optimize for availability => 40% of resource utilization
  - Balance availability and cost => 50% of resource utilization
  - Optimize for cost => 70% of resource utilization
  - Custom => choose own metric and target value
  - Options: Disable scale-in, cooldown period, warmup time (for ASG)

- **Predictive scaling:** continuously forecast load and schedule scaling ahead

Developer problems on AWS

- Managing infrastructure

- Deploying Code

- Configuring all the databases, load balancers, etc

- Scaling concerns

- Most web apps have the same architecture (ALB + ASG)

- All the developers want is for their code to run!

- Possibly, consistently across different applications and environments

Elastic Beanstalk – Overview

- Elastic Beanstalk is a developer centric view of deploying an application on AWS

- It uses all the component's we've seen before: EC2, ASG, ELB, RDS, …

- Managed service
    - Automatically handles capacity provisioning, load balancing, scaling, application health monitoring, instance configuration, …
    - Just the application code is the responsibility of the developer

- We still have full control over the configuration

- Beanstalk is free but you pay for the underlying instances

Elastic Beanstalk – Components

- **Application:** collection of Elastic Beanstalk components (environments, versions, configurations, …)

- **Application Version:** an iteration of your application code

- Environment
  - Collection of AWS resources running an application version (only one application version at a time)
  - **Tiers:** Web Server Environment Tier & Worker Environment Tier
  - You can create multiple environments (dev, test, prod, …)

update version

| Create Application | → | Upload Version | → | Launch Environment | → | Manage Environment |

deploy new version
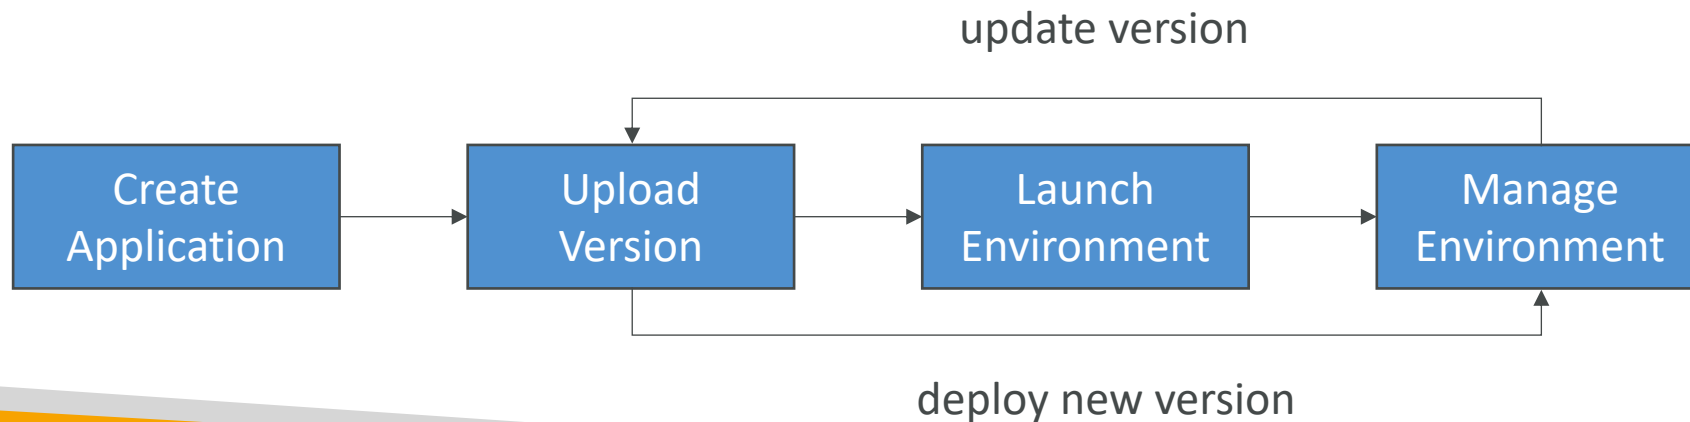

Elastic Beanstalk – Supported Platforms

- Go
- Java SE
- Java with Tomcat
- .NET Core on Linux
- .NET on Windows Server
- Node.js
- PHP
- Python

- Ruby
- Packer Builder
- Single Container Docker
- Multi-container Docker
- Preconfigured Docker

Web Server Tier vs. Worker Tier
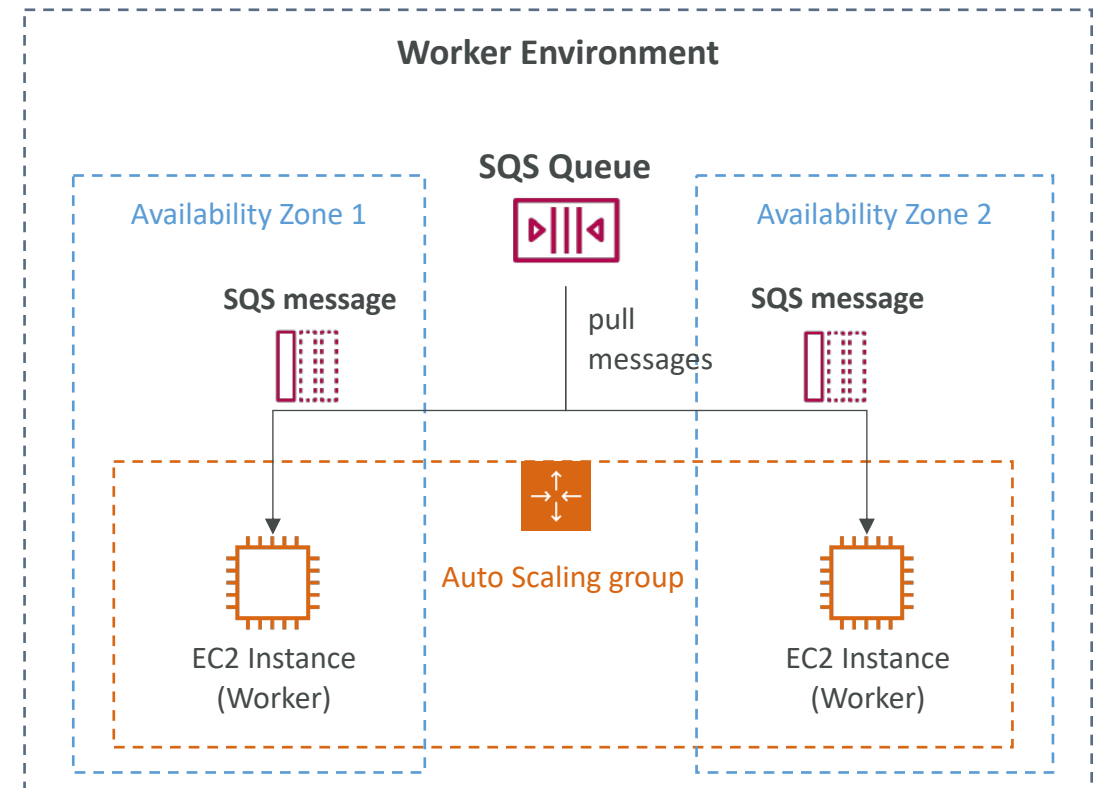

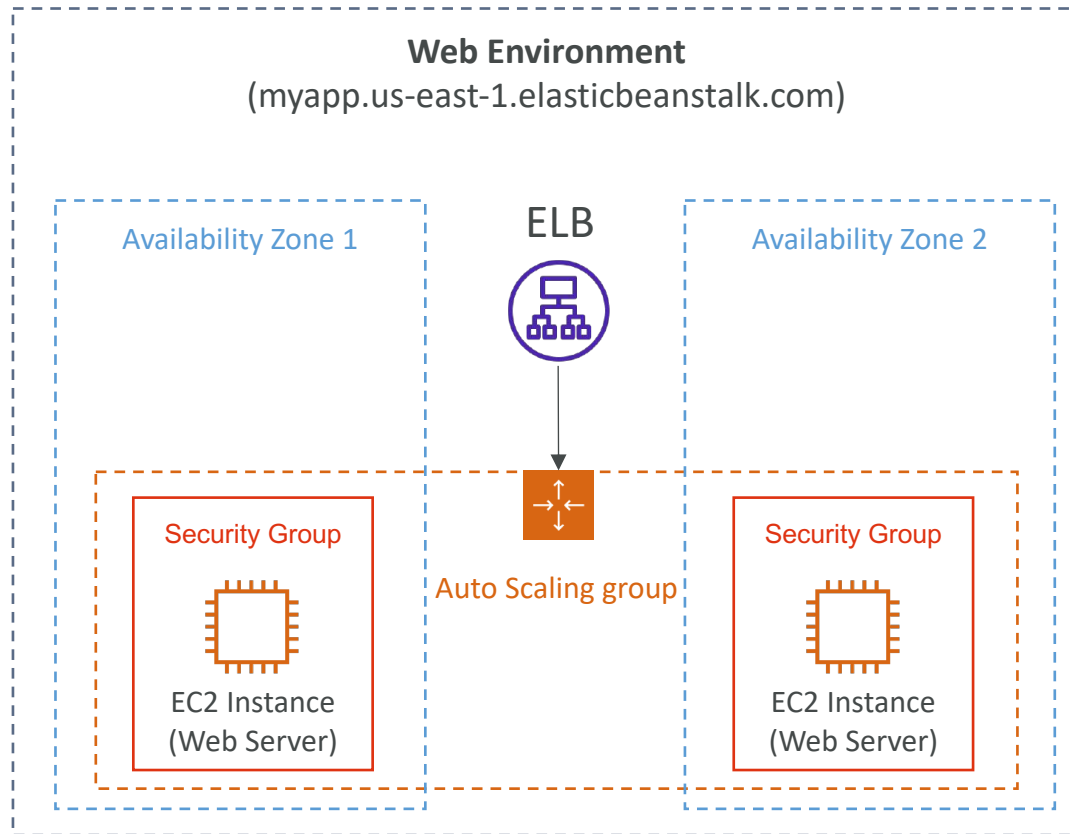

- Scale based on the number of SQS messages
- Can push messages to SQS queue from another Web Server Tier

Elastic Beanstalk Deployment Modes

Single Instance
Great for dev
High Availability with Load Balancer
Great for prod
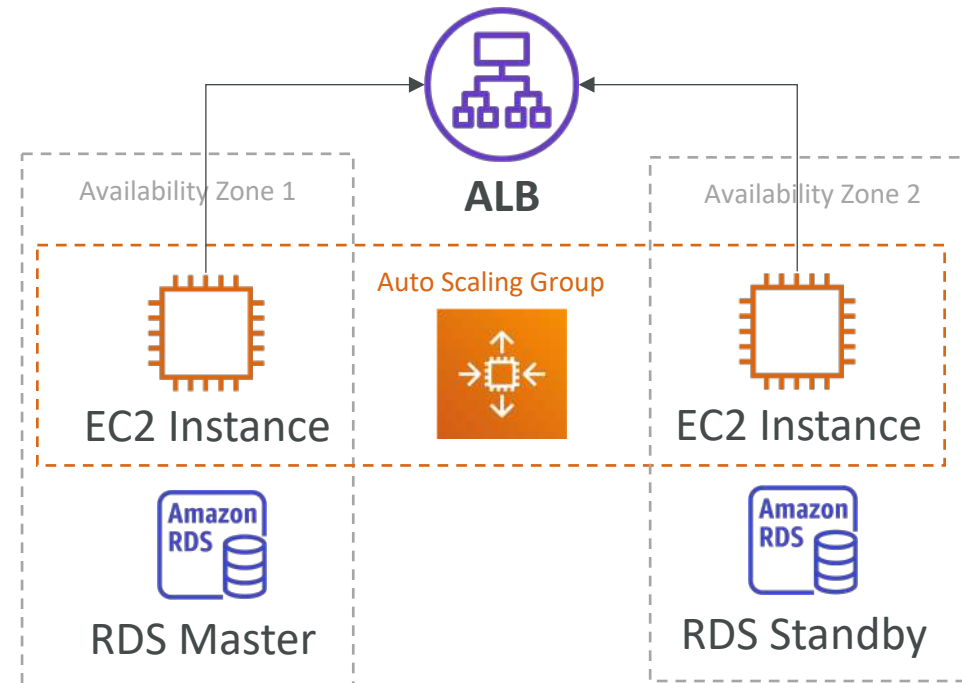

AWS CloudFormation

Managing your infrastructure as code

AWS CloudFormation

- CloudFormation is a declarative way of outlining your AWS Infrastructure, for any resources (most of them are supported)
- For example, within a CloudFormation template, you say:
  - I want a security group
  - I want two EC2 instances using this security group
  - I want two Elastic IPs for these EC2 instances
  - I want an S3 bucket
  - I want a load balancer (ELB) in front of these EC2 instances

- Then CloudFormation creates those for you, in the **right order**, with the **exact configuration** that you specify

CloudFormation – Template Example

Benefits of AWS CloudFormation (1/2)

- Infrastructure as code
  - No resources are manually created, which is excellent for control
  - The code can be version controlled for example using Git
  - Changes to the infrastructure are reviewed through code

- Cost
  - Each resources within the stack is tagged with an identifier so you can easily see how much a stack costs you
  - You can estimate the costs of your resources using the CloudFormation template
  - Savings strategy: In Dev, you could automation deletion of templates at 5 PM and recreated at 8 AM, safely

Benefits of AWS CloudFormation (2/2)

- Productivity
  - Ability to destroy and re-create an infrastructure on the cloud on the fly
  - Automated generation of Diagram for your templates!
  - Declarative programming (no need to figure out ordering and orchestration)

- Separation of concern: create many stacks for many apps, and many layers. Ex:
  - VPC stacks
  - Network stacks
  - App stacks

- Don't re-invent the wheel
  - Leverage existing templates on the web!
  - Leverage the documentation

How CloudFormation Works

- Templates must be uploaded in S3 and then referenced in CloudFormation
- To update a template, we can't edit previous ones. We have to re-upload a new version of the template to AWS
- Stacks are identified by a name
- Deleting a stack deletes every single artifact that was created by CloudFormation.
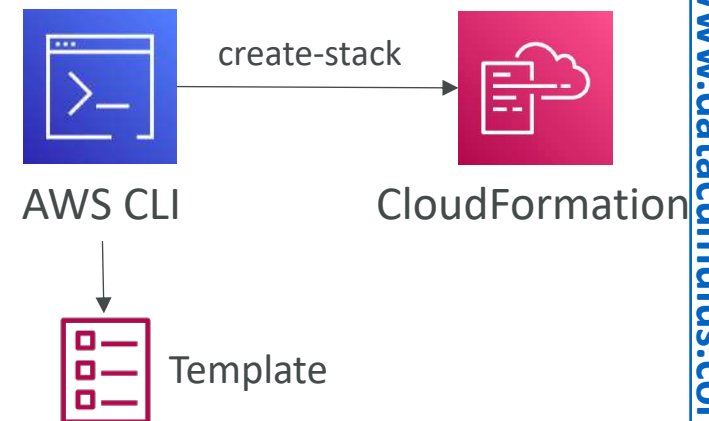

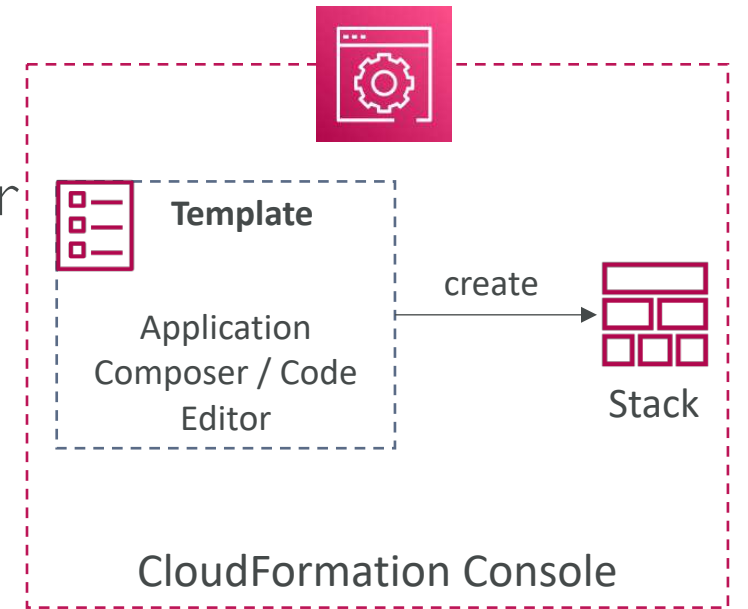

Deploying CloudFormation Templates

- Manual way
  - Editing templates in Application Composer or code editor
  - Using the console to input parameters, etc…
  - We'll mostly do this way in the course for learning purposes

- Automated way
  - Editing templates in a YAML file
  - Using the AWS CLI (Command Line Interface) to deploy the templates, or using a Continuous Delivery (CD) tool
  - Recommended way when you fully want to automate your flow

# CloudFormation – Building Blocks

- Template's Components
  - AWSTemplateFormatVersion – identifies the capabilities of the template "2010-09-09"
  - Description – comments about the template
  - **Resources (MANDATORY) – your AWS resources declared in the template**
  - Parameters – the dynamic inputs for your template
  - Mappings – the static variables for your template
  - Outputs – references to what has been created
  - Conditionals – list of conditions to perform resource creation

- Template's Helpers
  - References
  - Functions

Introductory Example

- We're going to create a simple EC2 instance

- And we're going to add security group to it

- For now, forget about the code syntax

- We'll look at the structure of the files later

- We'll see how in no-time, we are able to get started with CloudFormation!

Port: 22
Port: 80

    description: Super Hoop
    price: 2392.00
```

- YAML and JSON are the languages you can use for CloudFormation
- JSON is horrible for CF
- YAML is great in so many ways
- Let's learn a bit about it!

- Key value Pairs
- Nested objects
- Support Arrays
- Multi line strings
- Can include comments!

CloudFormation – Resources

- Resources are the core of your CloudFormation template (**MANDATORY**)
- They represent the different AWS Components that will be created and configured
- Resources are declared and can reference each other

- AWS figures out creation, updates and deletes of resources for us
- There are over 700 types of resources (!)
- Resource types identifiers are of the form:

service-provider::*service-name*::*data-type-name*

How do I find Resources documentation?

- I can't teach you all the 700+ resources, but I can teach you how to learn how to use them

- All the resources can be found here: https://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/aws-template-resource-type-ref.html

- Then, we just read the docs ☺

- Example here (for an EC2 instance): https://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/aws-resource-ec2-instance.html
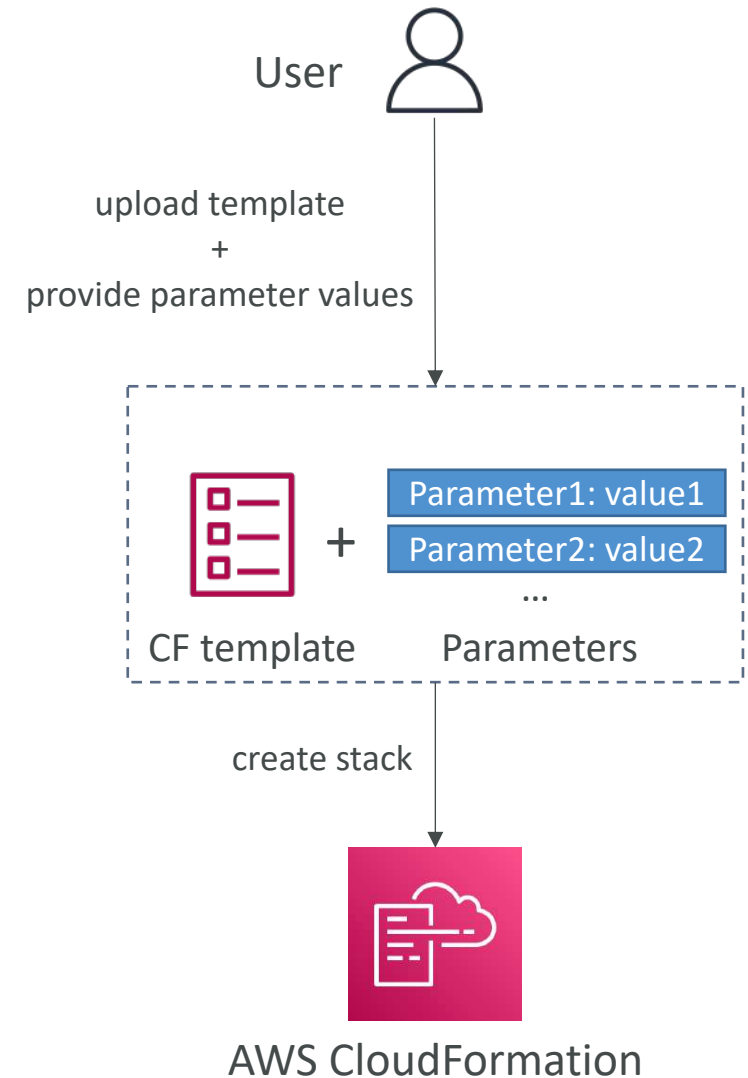

Analysis of CloudFormation Template

- Going back to the example of the introductory lecture, let's learn why it was written this way.

- Relevant documentation can be found here:
    - https://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/aws-resource-ec2-instance.html
    - https://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/aws-resource-ec2-securitygroup.html
    - http://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/aws-resource-ec2-eip.html

CloudFormation – Resources FAQ

- <u>Can I create a dynamic number of resources?</u>

➤ Yes, you can by using CloudFormation Macros and Transform

➤ It is not in the scope of this course

- <u>Is every AWS Service supported?</u>

➤ Almost. Only a select few niches are not there yet

➤ You can work around that using CloudFormation Custom Resources

CloudFormation – Parameters

- Parameters are a way to provide inputs to your AWS CloudFormation template

- They're important to know about if:
  - You want to <u>reuse</u> your templates across the company
  - Some inputs can not be determined ahead of time

- Parameters are extremely powerful, controlled, and can prevent errors from happening in your templates, thanks to types

User

upload template
+
provide parameter values

Parameter1: value1
Parameter2: value2
...

CF template   Parameters

create stack

AWS CloudFormation

When should you use a Parameter?

```
Parameters:
    SecurityGroupDescription:
        Description: Security Group Description
        Type: String
```

- Ask yourself this:
  - Is this CloudFormation resource configuration likely to change in the future?
  - If so, make it a parameter

- You won't have to re-upload a template to change its content ☺

CloudFormation – Parameters Settings

- Parameters can be controlled by all these settings:
    - Type:
        - String
        - Number
        - CommaDelimitedList
        - List<Number>
        - AWS-Specific Parameter (to help catch invalid values – match against existing values in the AWS account)
        - List<AWS-Specific Parameter>
        - SSM Parameter (get parameter value from SSM Parameter store)

    - Description
    - ConstraintDescription (String)
    - Min/MaxLength
    - Min/MaxValue
    - Default
    - AllowedValues (array)
    - AllowedPattern (regex)
    - NoEcho (Boolean)

CloudFormation – Parameters Example

AllowedValues

```yaml
Parameters:
  InstanceType:
    Description: Choose an EC2 instance type
    Type: String
    AllowedValues:
      - t2.micro
      - t2.small
      - t2.medium
    Default: t2.micro

Resources:
  MyEC2Instance:
    Type: AWS::EC2::Instance
    Properties:
      InstanceType: !Ref InstanceType
      ImageId: ami-0c02fb55956c7d316
```

NoEcho

```yaml
Parameters:
  DBPassword:
    Description: The database admin password
    Type: String
    NoEcho: true

Resources:
  MyDBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      DBInstanceClass: db.t2.micro
      AllocatedStorage: 20
      Engine: mysql
      MasterUsername: admin
      MasterUserPassword: !Ref DBPassword
      DBInstanceIdentifier: mydbinstance
```

How to Reference a Parameter?

```yaml
Resources:
    DBSubnet1:
        Type: AWS::EC2::Subnet
        Properties:
            VpcId: !Ref MyVPC
```

- The Fn::Ref function can be leveraged to reference parameters
- Parameters can be used anywhere in a template
- The shorthand for this in YAML is !Ref
- The function can also reference other elements within the template

CloudFormation – Pseudo Parameters

- AWS offers us Pseudo Parameters in any CloudFormation template
- These can be used at any time and are enabled by default
- Important pseudo parameters:

Reference Value	Example Returned Value
AWS::AccountId	123456789012
AWS::Region	us-east-1
AWS::StackId	arn:aws:cloudformation:us-east-1:123456789012:stack/MyStack/1c2fa620-982a-11e3-aff7-50e2416294e0
AWS::StackName	MyStack
AWS::NotificationARNs	[arn:aws:sns:us-east-1:123456789012:MyTopic]
AWS::NoValue	Doesn't return a value

CloudFormation – Mappings

- Mappings are fixed variables within your CloudFormation template
- They're very handy to differentiate between different environments (dev vs prod), regions (AWS regions), AMI types…
- All the values are hardcoded within the template

```
Mappings:
    Mapping01:
        Key01:
            Name: Value01
        Key02:
            Name: Value02
        Key03:
            Name: Value03
```

```
RegionMap:
    us-east-1:
        HVM64: ami-0ff8a91507f77f867
        HVMG2: ami-0a584ac55a7631c0c
    us-west-1:
        HVM64: ami-0bdb828fd58c52235
        HVMG2: ami-066ee5fd4a9ef77f1
    eu-west-1:
        HVM64: ami-047bb4163c506cd98
        HVMG2: ami-0a7c483d527806435
```

Accessing Mapping Values (Fn::FindInMap)

- We use Fn::FindInMap to return a named value from a specific key

- !FindInMap [MapName, TopLevelKey, SecondLevelKey]

```
Mappings:
  RegionMap:
    us-east-1:
      HVM64: ami-0ff8a91507f77f867
      HVMG2: ami-0a584ac55a7631c0c
    us-west-1:
      HVM64: ami-0bdb828fd58c52235
      HVMG2: ami-066ee5fd4a9ef77f1

Resources:
  MyEC2Instance:
    Type: AWS::EC2::Instance
    Properties:
      ImageId: !FindInMap [RegionMap, !Ref "AWS::Region", HVM64]
      InstanceType: t2.micro
```

Mappings work great for AMIs
Because AMIs are region-specific!

When would you use Mappings vs. Parameters?

- Mappings are great when you know in advance all the values that can be taken and that they can be deduced from variables such as
  - Region
  - Availability Zone
  - AWS Account
  - Environment (dev vs prod)
  - etc…
- They allow safer control over the template

- Use parameters when the values are really user specific

CloudFormation – Outputs

- The Outputs section declares *optional* outputs values that we can import into other stacks (if you export them first)!

- You can also view the outputs in the AWS Console or in using the AWS CLI

- They're very useful for example if you define a network CloudFormation, and output the variables such as VPC ID and your Subnet IDs

- It's the best way to perform some collaboration cross stack, as you let expert handle their own part of the stack

Network Stack

Exported Output

VPC ID: vpc-2f09a348

reference

Application Stack
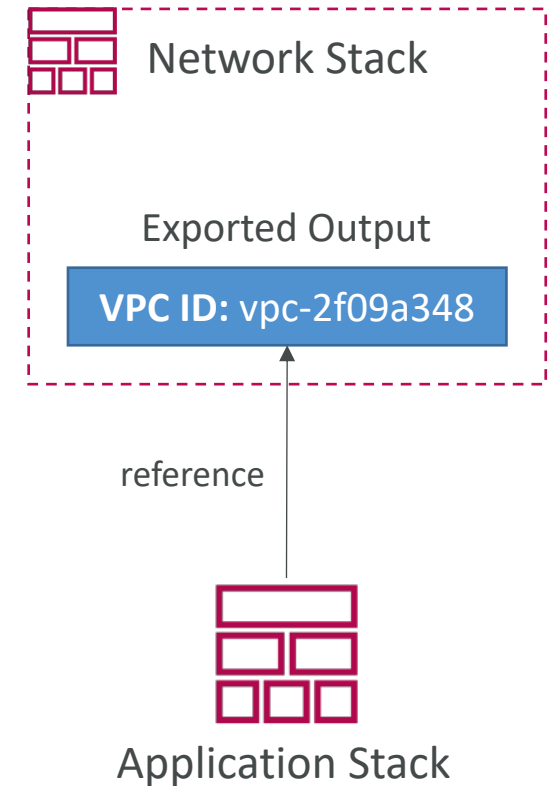

CloudFormation – Outputs

- Creating a SSH Security Group as part of one template
- We create an output that references that security group

```
Outputs:
    StackSSHSecurityGroup:
        Description: The SSH Security Group for our Company
        Value: !Ref MyCompanyWideSSHSecurityGroup
        Export:
            Name: SSHSecurityGroup
```

CloudFormation – Outputs Cross-Stack Reference

- We then create a second template that leverages that security group
- For this, we use the Fn::ImportValue function
- You can't delete the underlying stack until all the references are deleted

```
Resources:
  MySecureInstance:
    Type: AWS::EC2::Instance
    Properties:
      ImageId: ami-0742b4e673072066f
      InstanceType: t2.micro
      AvailabilityZone: us-east-1a
      SecurityGroups:
        - !ImportValue SSHSecurityGroup
```

CloudFormation – Conditions

- Conditions are used to control the creation of resources or outputs based on a condition

- Conditions can be whatever you want them to be, but common ones are:
  - Environment (dev / test / prod)
  - AWS Region
  - Any parameter value

- Each condition can reference another condition, parameter value or mapping
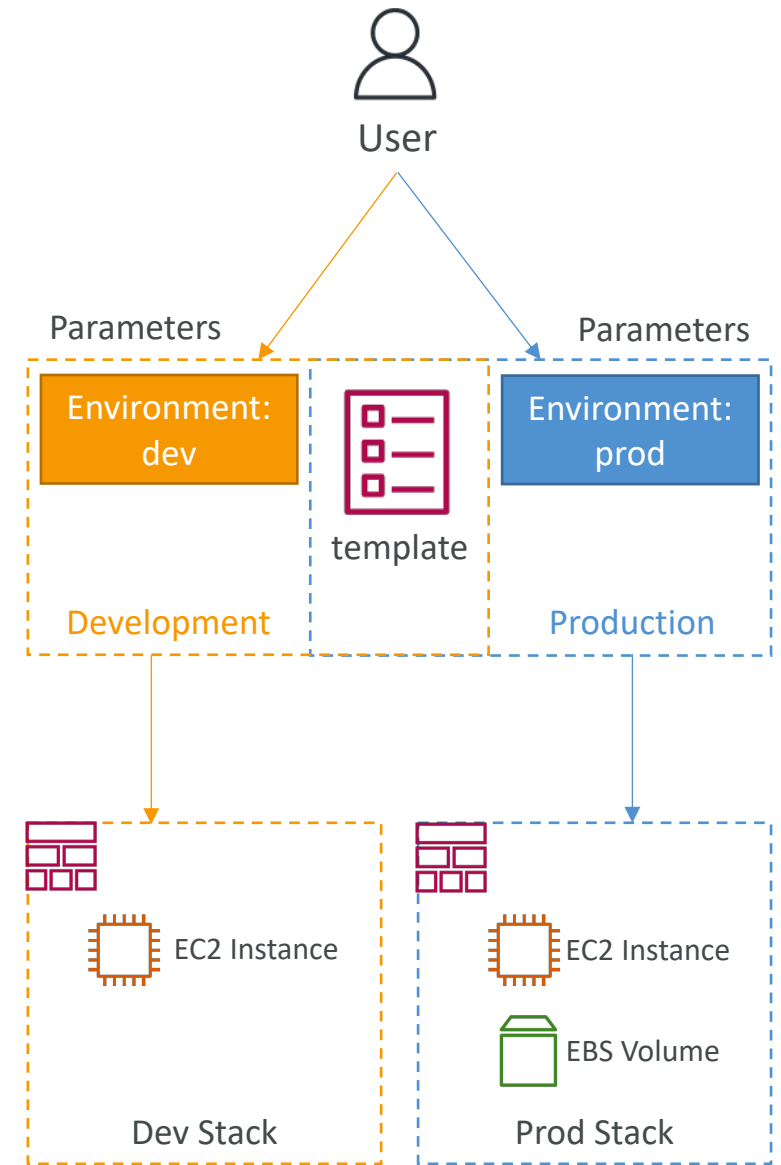

How to define a Condition

```
Conditions:
    CreateProdResources: !Equals [ !Ref EnvType, prod ]
```

- The logical ID is for you to choose. It's how you name condition
- The intrinsic function (logical) can be any of the following:
    - Fn::And
    - Fn::Equals
    - Fn::If
    - Fn::Not
    - Fn::Or

How to use a Condition

- Conditions can be applied to resources / outputs / etc…

```
Resources:
  MountPoint:
    Type: AWS::EC2::VolumeAttachment
    Condition: CreateProdResources
```

CloudFormation – Intrinsic Functions

Blue = must know

- Ref
- Fn::GetAtt
- Fn::FindInMap
- Fn::ImportValue
- Fn::Join
- Fn::Sub
- Fn::ForEach
- Fn::ToJsonString
- Condition Functions (Fn::If, Fn::Not, Fn::Equals, etc…)

- Fn::Base64
- Fn::Cidr
- Fn::GetAZs
- Fn::Select
- Fn::Split
- Fn::Transform
- Fn::Length

Intrinsic Functions – Fn::Ref

- The Fn::Ref function can be leveraged to reference
  - **Parameters** – returns the value of the parameter
  - **Resources** – returns the physical ID of the underlying resource (e.g., EC2 ID)
- The shorthand for this in YAML is !Ref

```
Resources:
    DBSubnet1:
        Type: AWS::EC2::Subnet
        Properties:
            VpcId: !Ref MyVPC
```

Intrinsic Functions – Fn::GetAtt

- Attributes are attached to any resources you create
- To know the attributes of your resources, the best place to look at is the documentation
- Example: the AZ of an EC2 instance!

```yaml
Resources:
  EC2Instance:
    Type: AWS::EC2::Instance
    Properties:
      ImageId: ami-0742b4e673072066f
      InstanceType: t2.micro
```

```yaml
EBSVolume:
  Type: AWS::EC2::Volume
  Condition: CreateProdResources
  Properties:
    Size: 100
    AvailabilityZone: !GetAtt EC2Instance.AvailabilityZone
```

Intrinsic Functions – Fn::FindInMap

- We use Fn::FindInMap to return a named value from a specific key
- !FindInMap [MapName, TopLevelKey, SecondLevelKey]

```yaml
Mappings:
  RegionMap:
    us-east-1:
      HVM64: ami-0ff8a91507f77f867
      HVMG2: ami-0a584ac55a7631c0c
    us-west-1:
      HVM64: ami-0bdb828fd58c52235
      HVMG2: ami-066ee5fd4a9ef77f1

Resources:
  MyEC2Instance:
    Type: AWS::EC2::Instance
    Properties:
      ImageId: !FindInMap [RegionMap, !Ref "AWS::Region", HVM64]
      InstanceType: t2.micro
```

Intrinsic Functions – Fn::ImportValue

- Import values that are exported in other stacks
- For this, we use the Fn::ImportValue function

```
Resources:
    MySecureInstance:
        Type: AWS::EC2::Instance
        Properties:
            ImageId: ami-0742b4e673072066f
            InstanceType: t2.micro
            AvailabilityZone: us-east-1a
            SecurityGroups:
                - !ImportValue SSHSecurityGroup
```

www.datacumulus.com

Intrinsic Functions – Fn::Base64

- Convert **String** to it's **Base64** representation

```
!Base64 "ValueToEncode"
```

- Example: pass encoded data to EC2 Instance's **UserData** property

```
Resources:
  WebServer:
    Type: AWS::EC2::Instance
    Properties:
      ...
      UserData:
        Fn::Base64: |
          #!/bin/bash
          dnf update –y
          dnf install –y httpd
```

Intrinsic Functions – Condition Functions

```
Conditions:
    CreateProdResources: !Equals [ !Ref EnvType, prod ]
```

- The logical ID is for you to choose. It's how you name condition
- The intrinsic function (logical) can be any of the following:
  - Fn::And
  - Fn::Equals
  - Fn::If
  - Fn::Not
  - Fn::Or

CloudFormation – Rollbacks

- Stack Creation Fails:
  - Default: everything rolls back (gets deleted). We can look at the log
  - Option to disable rollback and troubleshoot what happened

- Stack Update Fails:
  - The stack automatically rolls back to the previous known working state
  - Ability to see in the log what happened and error messages

- Rollback Failure? Fix resources manually then issue **ContinueUpdateRollback API** from Console
  - Or from the CLI using continue-update-rollback API call

CloudFormation – Service Role

- IAM role that allows CloudFormation to create/update/delete stack resources on your behalf
- Give ability to users to create/update/delete the stack resources even if they don't have permissions to work with the resources in the stack
- Use cases:
  - You want to achieve the least privilege principle
  - But you don't want to give the user all the required permissions to create the stack resources
- User must have **iam:PassRole** permissions

Permissions
- cloudformation:*
- **iam:PassRole**

User

Template

Service Role
- s3:*Bucket

CloudFormation

S3 bucket

Stack
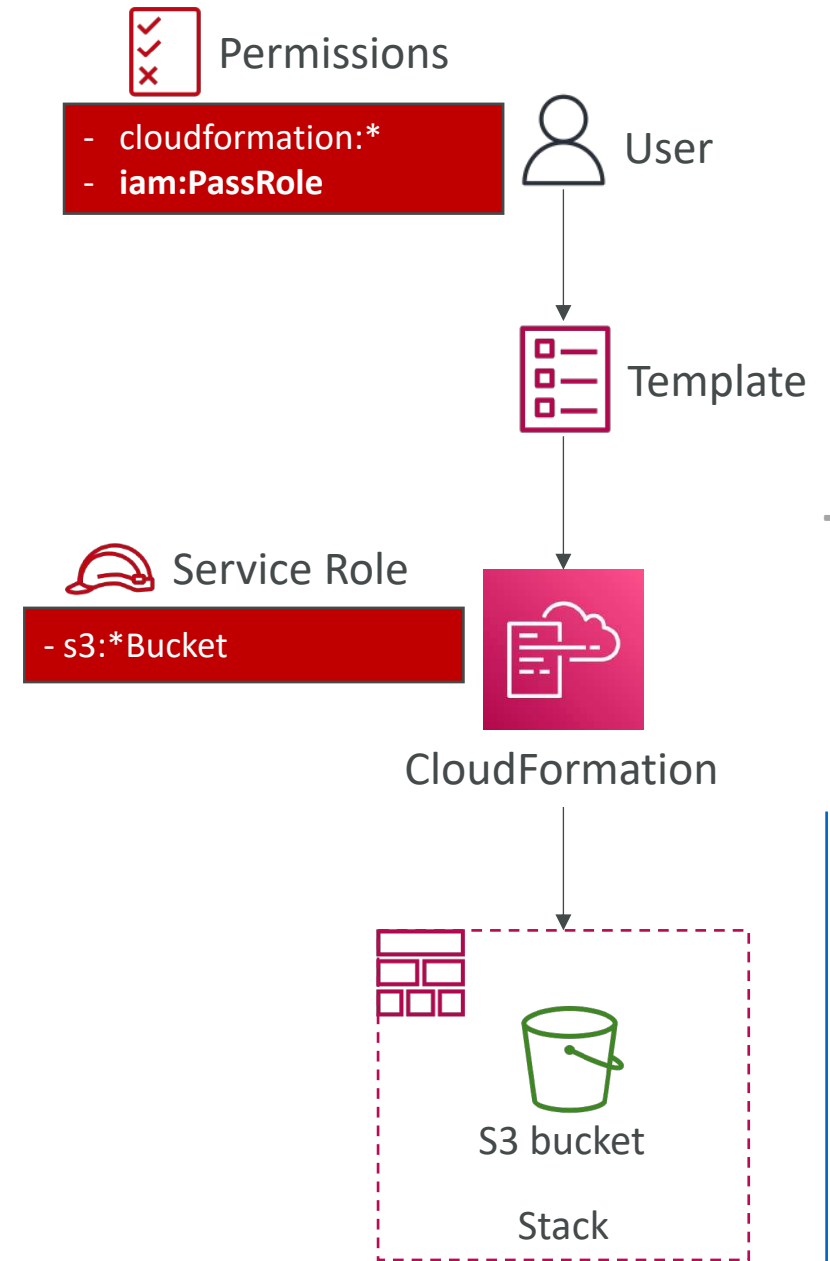

CloudFormation Capabilities

- CAPABILITY_NAMED_IAM and CAPABILITY_IAM
  - Necessary to enable when you CloudFormation template is creating or updating IAM resources (IAM User, Role, Group, Policy, Access Keys, Instance Profile…)
  - Specify **CAPABILITY_NAMED_IAM** if the resources are named

- CAPABILITY_AUTO_EXPAND
  - Necessary when your CloudFormation template includes Macros or Nested Stacks (stacks within stacks) to perform dynamic transformations
  - You're acknowledging that your template may change before deploying

- InsufficientCapabilitiesException
  - Exception that will be thrown by CloudFormation if the capabilities haven't been acknowledged when deploying a template (security measure)

CloudFormation – DeletionPolicy Delete

- DeletionPolicy:
  - Control what happens when the CloudFormation template is deleted or when a resource is removed from a CloudFormation template
  - Extra safety measure to preserve and backup resources

- Default **DeletionPolicy=Delete**
  - ⚠️ **Delete** won't work on an S3 bucket if the bucket is not empty

```
Resources:
  MyEC2Instance:
    Type: AWS::EC2::Instance
    Properties:
      ImageId: ami-12345678
      InstanceType: t2.micro
      KeyName: my-key-pair
      SecurityGroupIds:
        - sg-12345678
    DeletionPolicy: Delete
```

```
Resources:
  MyS3Bucket:
    Type: AWS::S3::Bucket          ⚠️
    DeletionPolicy: Delete
```

CloudFormation – DeletionPolicy Retain

- DeletionPolicy=Retain:
  - Specify on resources to preserve in case of CloudFormation deletes
- Works with any resources

```yaml
Resources:
  MyDynamoDBTable:
    Type: AWS::DynamoDB::Table
    Properties:
      TableName: MyTable
      AttributeDefinitions:
        - AttributeName: ID
          AttributeType: S
      KeySchema:
        - AttributeName: ID
          KeyType: HASH
      ProvisionedThroughput:
        ReadCapacityUnits: 5
        WriteCapacityUnits: 5
    DeletionPolicy: Retain
```

CloudFormation – DeletionPolicy Snapshot

- **DeletionPolicy=Snapshot**
- Create one final snapshot before deleting the resource
- Examples of supported resources:
  - EBS Volume, ElastiCache Cluster, ElastiCache ReplicationGroup
  - RDS DBInstance, RDS DBCluster, Redshift Cluster, Neptune DBCluster, DocumentDB DBCluster

```
Resources:
  MyDBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      DBInstanceClass: db.t2.micro
      AllocatedStorage: 20
      Engine: mysql
      MasterUsername: admin
      MasterUserPassword: "ExamplePassword"
    DeletionPolicy: Snapshot
```

CloudFormation – Stack Policies

- During a CloudFormation Stack update, all update actions are allowed on all resources (default)

- A Stack Policy is a JSON document that defines the update actions that are allowed on specific resources during Stack updates

- Protect resources from unintentional updates

- When you set a Stack Policy, all resources in the Stack are protected by default

- Specify an explicit ALLOW for the resources you want to be allowed to be updated

```
{
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "Update:*",
            "Principal": "*",
            "Resource": "*"
        },
        {
            "Effect": "Deny",
            "Action": "Update:*",
            "Principal": "*",
            "Resource": "LogicalResourceId/ProductionDatabase"
        }
    ]
}
```

Allow updates on all resources
except the ProductionDatabase

CloudFormation – Termination Protection

- To prevent accidental deletes of CloudFormation Stacks, use **TerminationProtection**

CloudFormation – Custom Resources

- Used to
  - define resources not yet supported by CloudFormation
  - define custom provisioning logic for resources can that be outside of CloudFormation (on-premises resources, 3rd party resources…)
  - have custom scripts run during create / update / delete through Lambda functions (running a Lambda function to empty an S3 bucket before being deleted)
- Defined in the template using AWS::CloudFormation::CustomResource or Custom::*MyCustomResourceTypeName* (recommended)
- Backed by a Lambda function (most common) or an SNS topic

How to define a Custom Resource?

- **ServiceToken** specifies where CloudFormation sends requests to, such as Lambda ARN or SNS ARN (required & must be in the same region)
- Input data parameters (optional)

```
Resources:
  MyCustomResourceUsingLambda:
    Type: Custom::MyLambdaResource
    Properties:
      ServiceToken: arn:aws:lambda:REGION:ACCOUNT_ID:function:FUNCTION_NAME
      # Input values (optional)
      ExampleProperty: "ExampleValue"
```

Use Case – Delete content from an S3 bucket

- You can't delete a non-empty S3 bucket

- To delete a non-empty S3 bucket, you must first delete all the objects inside it

- We can use a custom resource to empty an S3 bucket before it gets deleted by CloudFormation

User

delete stack

CloudFormation

Stack

Custom resource ⟷ Lambda function

empty bucket

S3 bucket
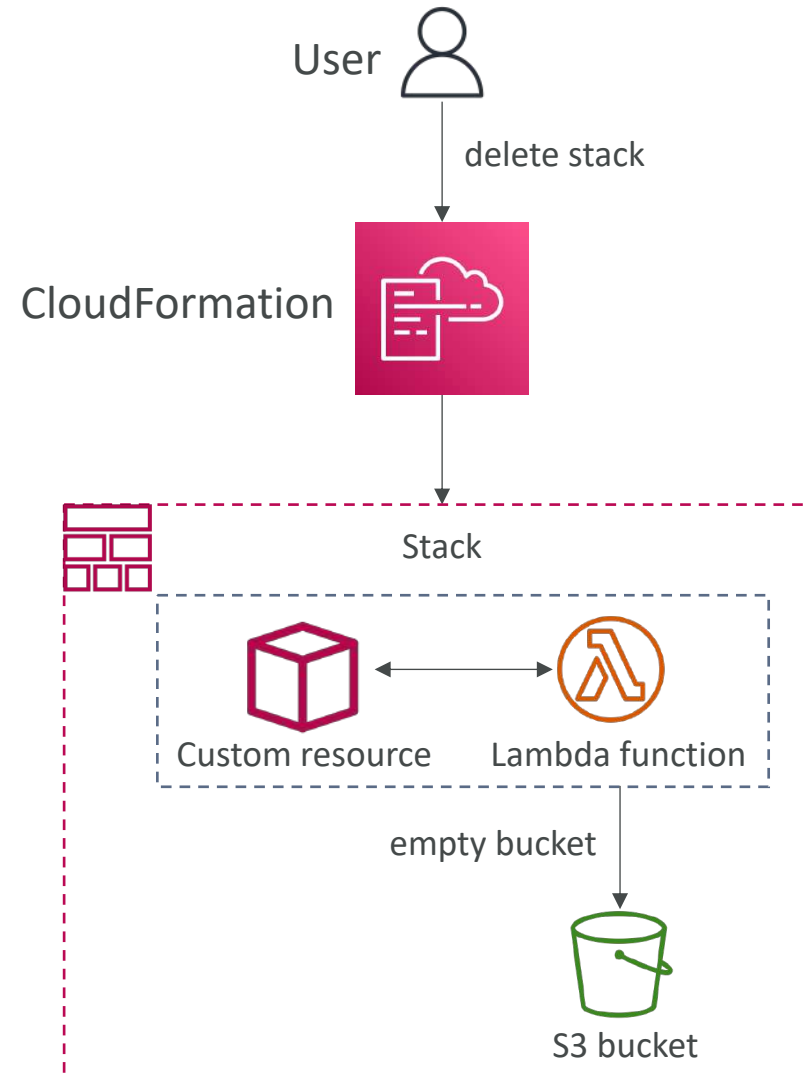

CloudFormation – Dynamic References

- Reference external values stored in **Systems Manager Parameter Store** and **Secrets Manager** within CloudFormation templates

- CloudFormation retrieves the value of the specified reference during **create/update/delete operations**

- For example: retrieve RDS DB Instance master password from Secrets Manager

- Supports
  - **ssm** – for plaintext values stored in SSM Parameter Store
  - **ssm-secure** – for secure strings stored in SSM Parameter Store
  - **secretsmanager** – for secret values stored in Secrets Manager

'{{resolve:*service-name*:*reference-key*}}'

Template

create/update

CloudFormation

result

get value
(reference-key)

SSM Parameter Store

Secrets Manager
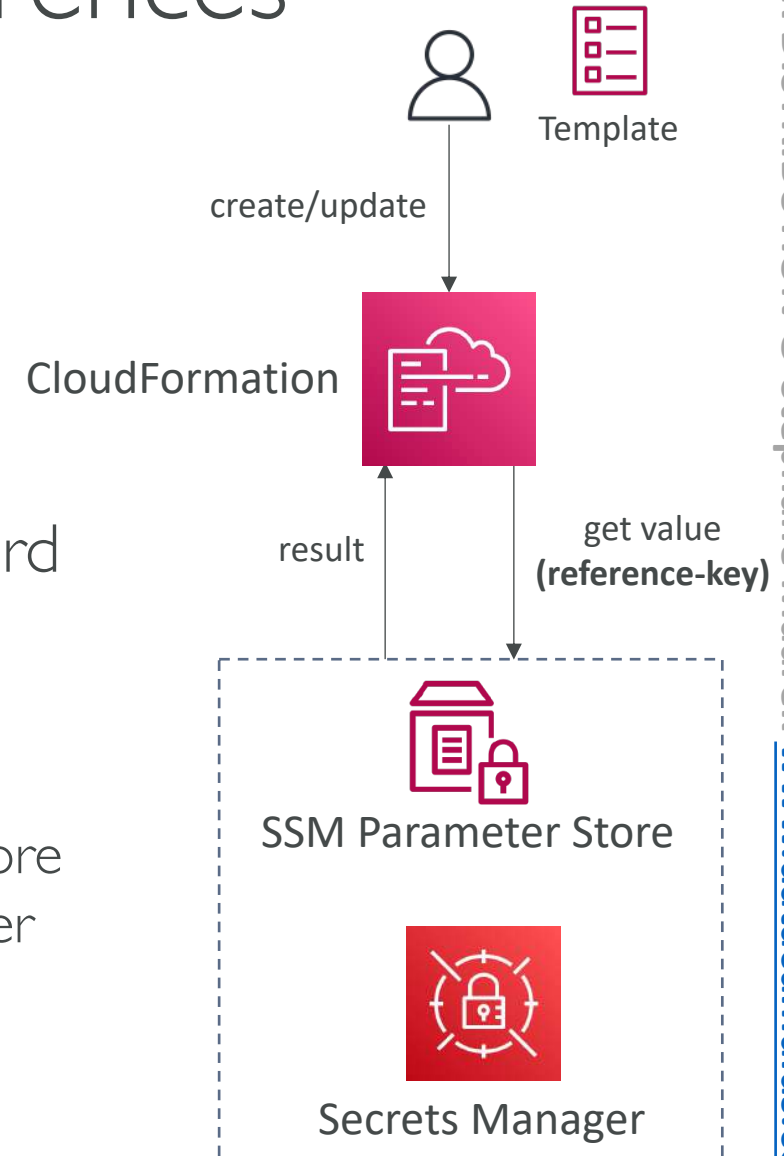

CloudFormation – Dynamic References

SSM

{{resolve:**ssm**:*parameter-name*:*version*}}

```
Resources:
  S3Bucket:
    Type: AWS::S3::Bucket
    Properties:
      AccessControl: '{{resolve:ssm:S3AccessControl:2}}'
```

SSM Secure

{{resolve:**ssm-secure**:*parameter-name*:*version*}}

```
Resources:
  IAMUser:
    Type: AWS::IAM::User
    Properties:
      UserName: john
      LoginProfile:
        Password: '{{resolve:ssm-secure:IAMUserPassword:10}}'
```

Secrets Manager

{{resolve:**secretsmanager**:*secret-id*:*secret-string*:*json-key*:*version-stage*:*version-id*}}

```
Resources:
  DBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      DBName: MyRDSInstance
      MasterUsername: '{{resolve:secretsmanager:MyRDSSecret:SecretString:username}}'
      MasterUserPassword: '{{resolve:secretsmanager:MyRDSSecret:SecretString:password}}'
```

© Stephane Maarek

CloudFormation, Secrets Manager & RDS
Option 1 – ManageMasterUserPassword

- **ManageMasterUserPassword** – creates admin secret implicitly
- RDS, Aurora will manage the secret in Secrets Manager and its rotation

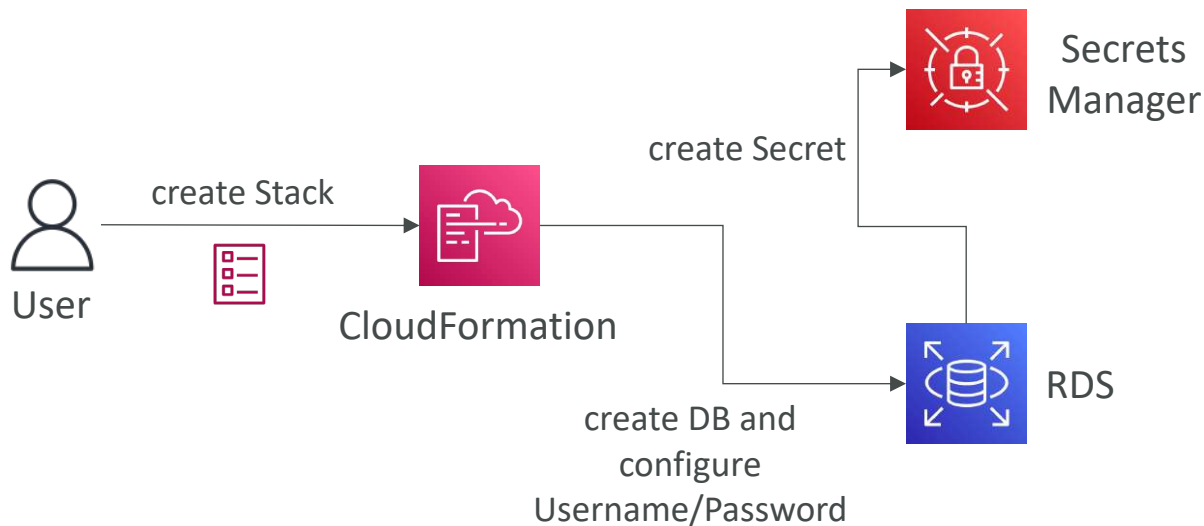

```
Resources:
  MyCluster:
    Type: AWS::RDS::DBCluster
    Properties:
      Engine: aurora-mysql
      MasterUsername: masteruser
      ManageMasterUserPassword: true

Outputs:
  Secret:
    Value: !GetAtt MyCluster.MasterUserSecret.SecretArn
```

CloudFormation, Secrets Manager & RDS Option 2 – Dynamic Reference

1. secret is generated

3. link the secret to RDS DB instance (for rotation)

```yaml
Resources:
  MyDatabaseSecret:
    Type: AWS::SecretsManager::Secret
    Properties:
      Name: MyDatabaseSecret
      GenerateSecretString:
        SecretStringTemplate: '{"username": "admin"}'
        GenerateStringKey: "password"
        PasswordLength: 16
        ExcludeCharacters: '"@/\'
```

```yaml
SecretRDSAttachment:
  Type: AWS::SecretsManager::SecretTargetAttachment
  Properties:
    SecretId: !Ref MyDatabaseSecret
    TargetId: !Ref MyDBInstance
    TargetType: AWS::RDS::DBInstance
```

```yaml
  MyDBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      DBName: mydatabase
      AllocatedStorage: 20
      DBInstanceClass: db.t2.micro
      Engine: mysql
      MasterUsername: '{{resolve:secretsmanager:MyDatabaseSecret:SecretString:username}}'
      MasterUserPassword: '{{resolve:secretsmanager:MyDatabaseSecret:SecretString:password}}'
```

2. Reference secret in RDS DB instance

User Data in EC2 for CloudFormation

- We can have user data at EC2 instance launch through the console
- Let's learn how to write the same EC2 user-data script in our CloudFormation template

- **The important thing to pass is the entire script through the function** Fn::Base64
- Good to know, user data script log is in **/var/log/cloud-init-output.log**

- Let's see how to do this in CloudFormation!

The Problems with EC2 User Data

- What if we want to have a very large instance configuration?

- What if we want to evolve the state of the EC2 instance without terminating it and creating a new one?

- How do we make EC2 user-data more readable?

- How do we know or signal that our EC2 user-data script completed successfully?

- Enter **CloudFormation Helper Scripts!**
  - Python scripts, that come directly on Amazon Linux AMIs, or can be installed using yum or dnf on non-Amazon Linux AMIs
  - **cfn-init, cfn-signal,** cfn-get-metadata, cfn-hup

AWS::CloudFormation::Init

- A config contains the following and is executed in that order
  - Packages: used to download and install pre-packaged apps and components on Linux/Windows (ex. MySQL, PHP, etc…)
  - Groups: define user groups
  - Users: define users, and which group they belong to
  - Sources: download files and archives and place them on the EC2 instance
  - Files: create files on the EC2 instance, using inline or can be pulled from a URL
  - Commands: run a series of commands
  - Services: launch a list of sysvinit

```
Resources:
  EC2Instance:
    Type: AWS::EC2::Instance
    Properties:
      ...
    Metadata:
      AWS::CloudFormation::Init:
        config:
          packages:
            ...
          groups:
            ...
          users:
            ...
          sources:
            ...
          files:
            ...
          commands:
            ...
          services:
            ...
```

CloudFormation – cfn-init

- Used to retrieve and interpret the resource metadata, installing packages, creating files and starting services

- With the cfn-init script, it helps make complex EC2 configurations readable

- The EC2 instance will query the CloudFormation service to get init data

- **AWS::CloudFormation::Init** must be in the Metadata of a resource

- Logs go to **/var/log/cfn-init.log**

CloudFormation

launch

retrieve init data

EC2 Instance
run **cfn-init**

CloudFormation – cfn-signal & Wait Conditions

- We still don't know how to tell CloudFormation that the EC2 instance got properly configured after a cfn-init

- For this, we can use the cfn-signal script!
  - We run cfn-signal right after cfn-init
  - Tell CloudFormation service that the resource creation success/fail to keep on going or fail

- We need to define WaitCondition:
  - Block the template until it receives a signal from cfn-signal
  - We attach a CreationPolicy (also works on EC2, ASG)
  - We can define a Count > 1 (in case you need more than 1 signal)

```
CreationPolicy:
    ResourceSignal:
        Timeout: PT5M
        Count: 1
```

CloudFormation

Wait Condition

launch

retrieve init data

signal from **cfn-signal**

EC2 Instance

run **cfn-init**
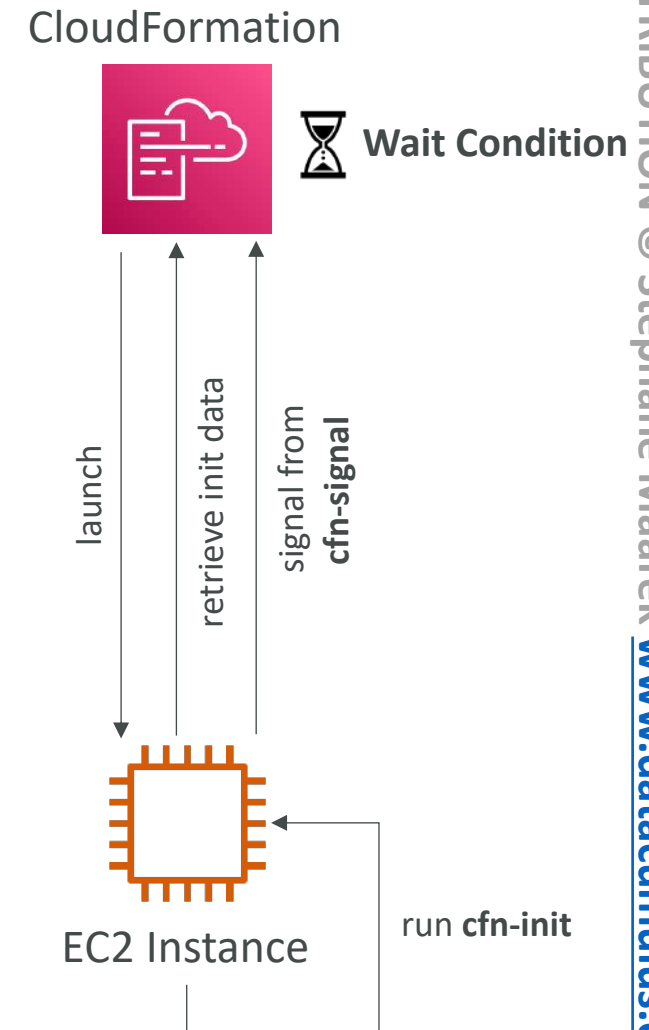

Wait Condition Didn't Receive the Required Number of Signals from an Amazon EC2 Instance

- Ensure that the AMI you're using has the AWS CloudFormation helper scripts installed. If the AMI doesn't include the helper scripts, you can also download them to your instance

- Verify that the cfn-init & cfn-signal command was successfully run on the instance. You can view logs, such as **/var/log/cloud-init.log** or **/var/log/cfn-init.log**, to help you debug the instance launch

- You can retrieve the logs by logging in to your instance, but you must disable rollback on failure or else AWS CloudFormation deletes the instance after your stack fails to create

- Verify that the instance has a connection to the Internet. If the instance is in a VPC, the instance should be able to connect to the Internet through a NAT device if it's is in a private subnet or through an Internet gateway if it's in a public subnet

- **For example, run:** curl -I https://aws.amazon.com

CloudFormation – Nested Stacks

- Nested stacks are stacks as part of other stacks
- They allow you to isolate repeated patterns / common components in separate stacks and call them from other stacks
- Example:
  - Load Balancer configuration that is re-used
  - Security Group that is re-used
- Nested stacks are considered best practice
- To update a nested stack, always update the parent (root stack)
- Nested stacks can have nested stacks themselves!

Stack A (root)

Stack B

Stack D

Stack C
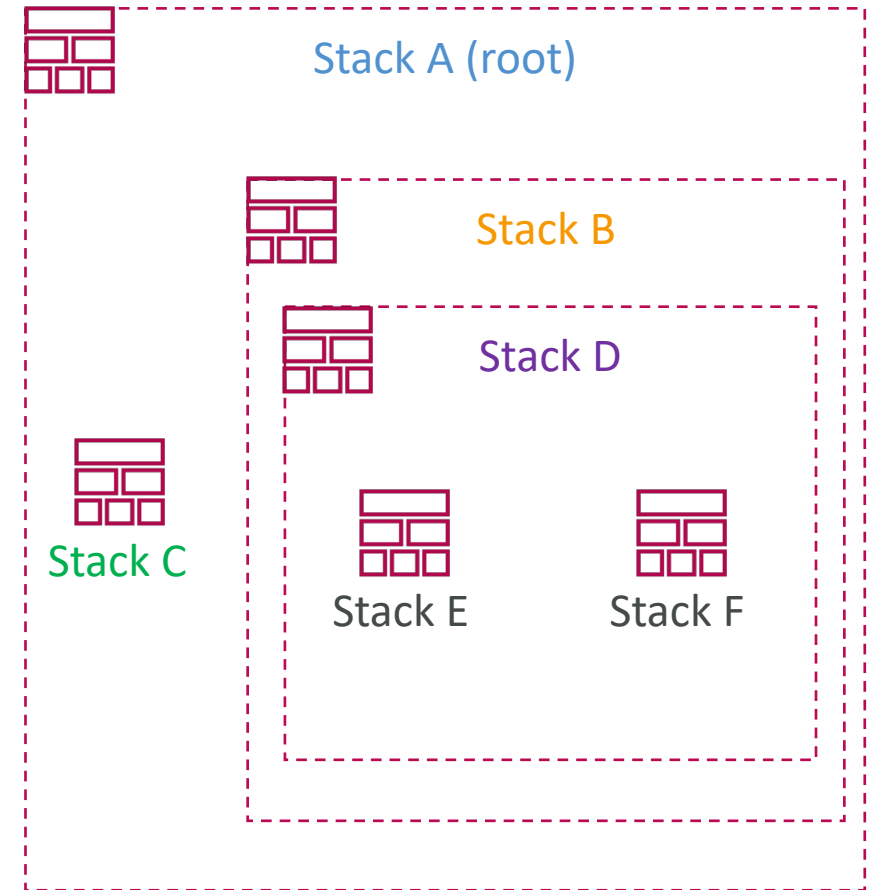

Stack E

Stack F

Cross Stacks vs. Nested Stacks

- Cross Stacks
  - Helpful when stacks have different lifecycles
  - Use Outputs Export and **Fn::ImportValue**
  - When you need to pass export values to many stacks (VPC Id…)

- Nested Stacks
  - Helpful when components must be re-used
  - Example: re-use how to properly configure an Application Load Balancer
  - The nested stack only is important to the higher-level stack (it's not shared)

VPC Stack

App 1 Stack

App 2 Stack

App 3 Stack

RDS Stack

ASG Stack

ELB Stack

App 1 Stack

RDS Stack

ASG Stack

ELB Stack

App 2 Stack
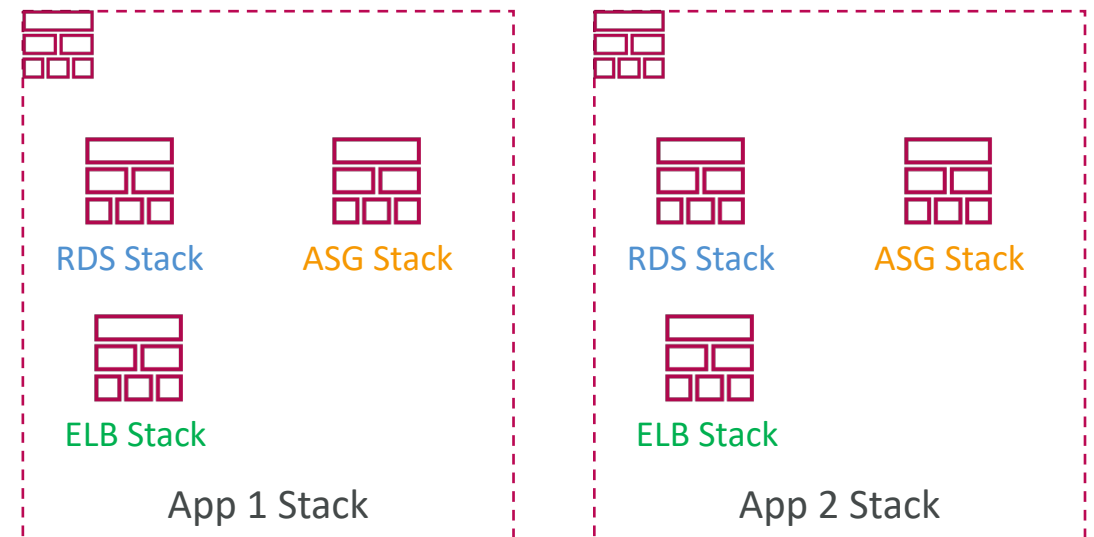

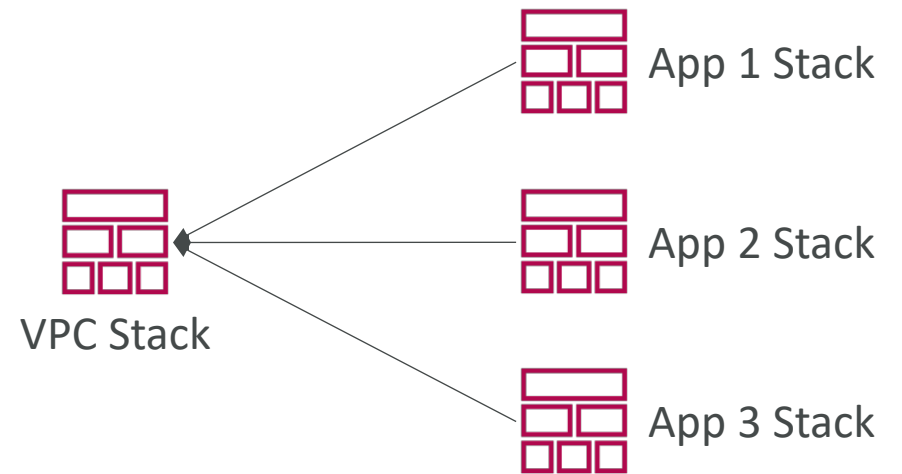

CloudFormation – DependsOn

- Specify that the creation of a specific resource follows another

- When added to a resource, that resource is created only after the creation of the resource specified in the **DependsOn** attribute

- Applied automatically when using !Ref and !GetAtt

- Use with any resource

```
Resources:
  EC2Instance:
    Type: AWS::EC2::Instance
    DependsOn: DBInstance
    Properties:
      ImageId: ami-0a3c3a20c09d6f377

  DBInstance:
    Type: AWS::RDS::DBInstance
    Properties:
      Engine: MySQL
      DBInstanceClass: db.t2.small
```

CloudFormation – StackSets

- Create, update, or delete stacks across **multiple accounts and regions** with a single operation/template
- Administrator account to create StackSets
- Target accounts to create, update, delete stack instances from StackSets
- When you update a stack set, *all* associated stack instances are updated throughout all accounts and regions
- Can be applied into all accounts of an AWS organizations
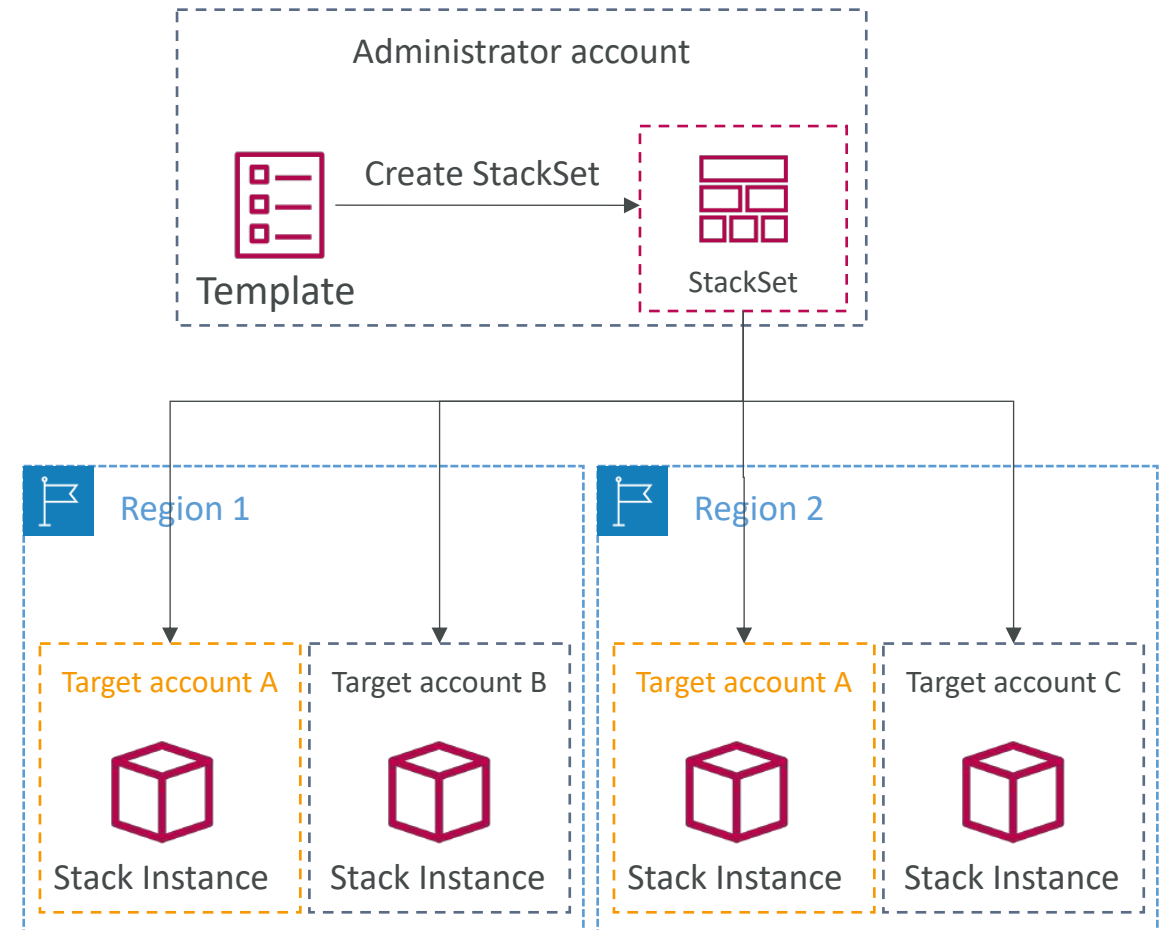

CloudFormation – StackSets Permission Models

- Self-managed Permissions
  - Create the IAM roles (with established trusted relationship) in both administrator and target accounts
  - Deploy to any target account in which you have permissions to create IAM role

- Service-managed Permissions
  - Deploy to accounts managed by AWS Organizations
  - StackSets create the IAM roles on your behalf (**enable trusted access** with AWS Organizations)
  - Must **enable all features** in AWS Organizations
  - Ability to deploy to accounts added to your organization in the future (Automatic Deployments)

Administrator account

AWSCloudFormationStackSet**Administration**Role

Trust relationship

Target accounts

AWSCloudFormationStackSet**Execution**Role

Management account

Target accounts
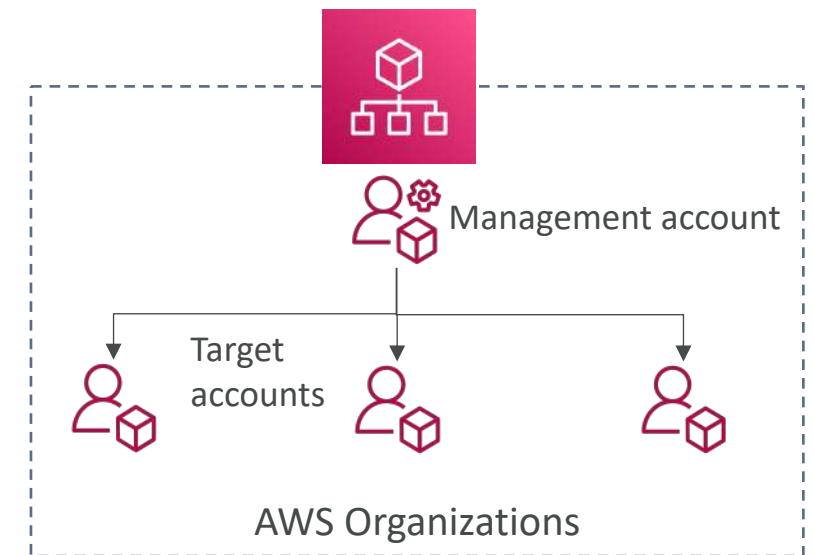

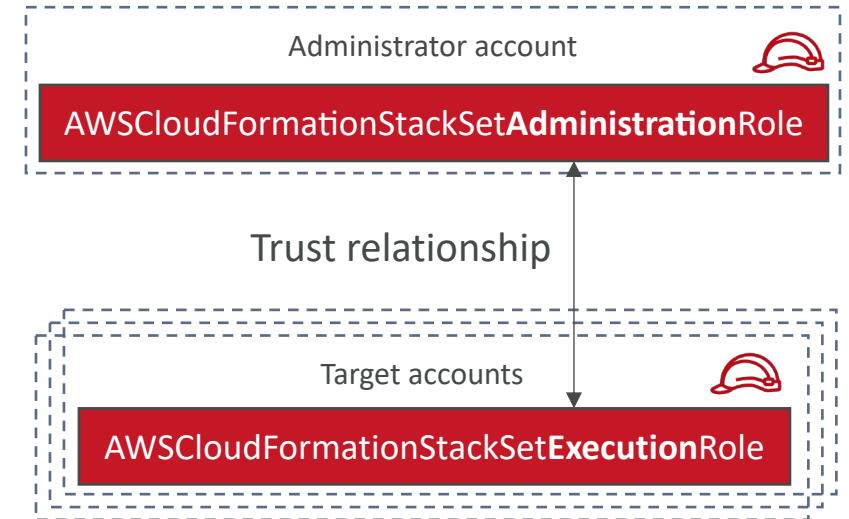

AWS Organizations

StackSets with AWS Organizations

- Ability to **<u>automatically</u>** deploy Stack instances to new Accounts in an Organization

- Can delegate StackSets administration to member accounts in AWS Organization
- **Trusted access with AWS Organizations must be enabled** before delegated administrators can deploy to accounts managed by Organizations

StackSets with AWS Organizations

www.datacumulus.com
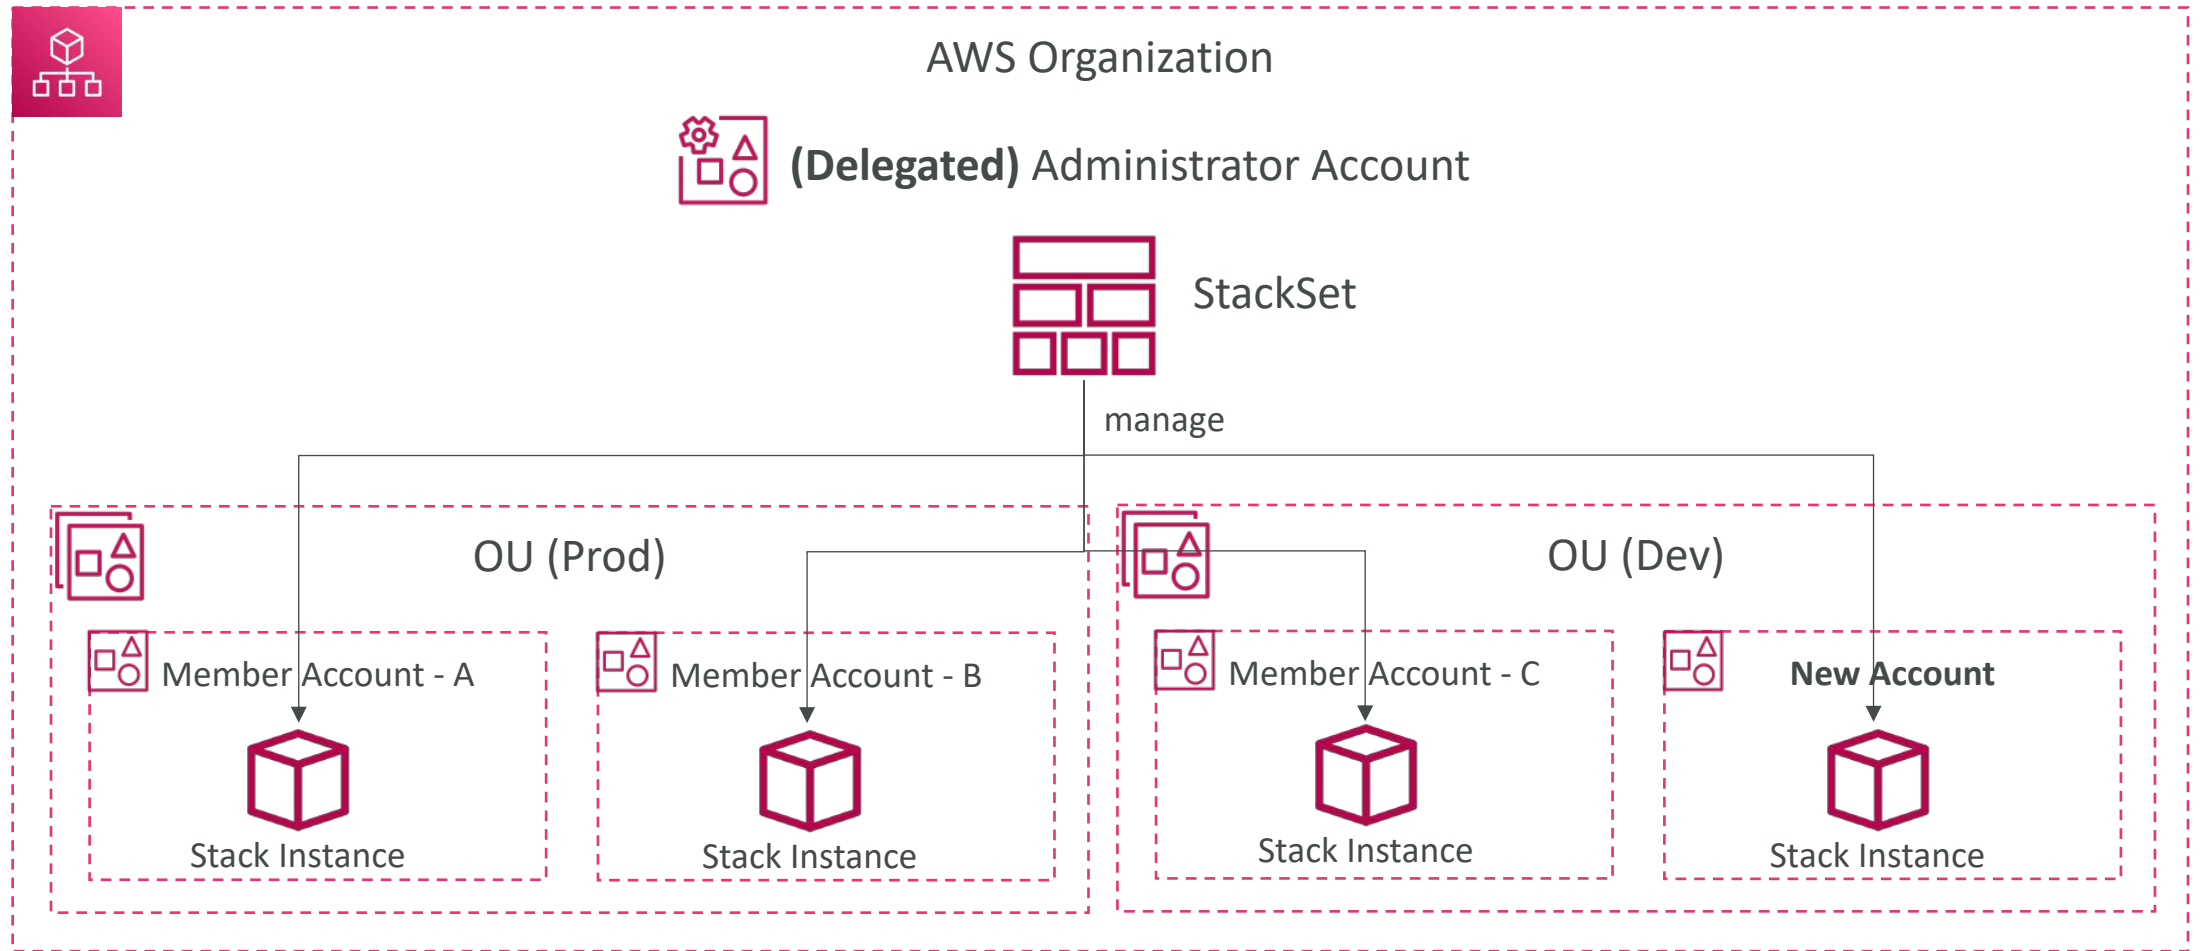

Hands-On: StackSets

- We'll use StackSets to enable AWS Config across AWS regions with a single click

- Let's see how this works!
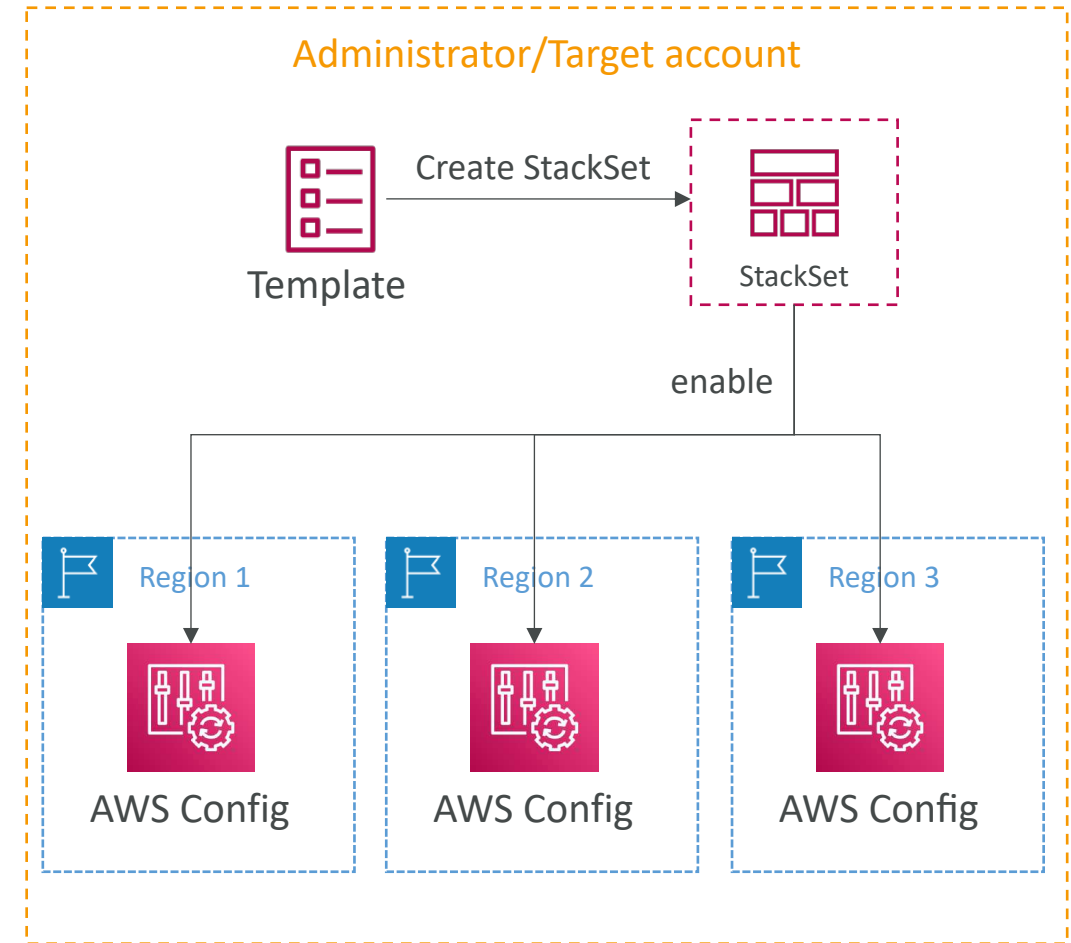

CloudFormation – Troubleshooting

- DELETE_FAILED
  - Some resources must be emptied before deleting, such as S3 buckets
  - Use Custom Resources with Lambda functions to automate some actions
  - Security Groups cannot be deleted until all EC2 instances in the group are gone
  - Think about using DeletionPolicy=Retain to skip deletions

- UPDATE_ROLLBACK_FAILED
  - Can be caused by resources changed outside of CloudFormation, insufficient permissions, Auto Scaling Group that doesn't receive enough signals…
  - Manually fix the error and then ContinueUpdateRollback

CloudFormation – StackSet Troubleshooting

- A stack operation failed, and the stack instance status is **OUTDATED**.
  - Insufficient permissions in a target account for creating resources that are specified in your template.
  - The template could be trying to create global resources that must be unique but aren't, such as S3 buckets
  - The administrator account does not have a trust relationship with the target account
  - Reached a limit or a quota in the target account (too many resources)

AWS Lambda

It's a Serverless world

Why AWS Lambda
Amazon EC2

- Virtual Servers in the Cloud
- Limited by RAM and CPU
- Continuously running
- Scaling means intervention to add / remove servers

Amazon Lambda

- Virtual **functions** – no servers to manage!
- Limited by time - **short executions**
- Run **on-demand**
- **Scaling is automated**!

Benefits of AWS Lambda

- Easy Pricing:
  - Pay per request and compute time
  - Free tier of 1,000,000 AWS Lambda requests and 400,000 GBs of compute time

- Integrated with the whole AWS suite of services

- Integrated with many programming languages

- Easy monitoring through AWS CloudWatch

- Easy to get more resources per functions (up to 10GB of RAM!)

- Increasing RAM will also improve CPU and network!

AWS Lambda language support

- Node.js (JavaScript)
- Python
- Java
- C# (.NET Core) / Powershell
- Ruby
- Custom Runtime API (community supported, example Rust or Golang)

- Lambda Container Image
  - The container image must implement the Lambda Runtime API
  - ECS / Fargate is preferred for running arbitrary Docker images

AWS Lambda Integrations
Main ones

API Gateway	Kinesis	DynamoDB	S3	CloudFront

CloudWatch Events EventBridge	CloudWatch Logs	SNS	SQS	Cognito
Example: Serverless Thumbnail creation

New image in S3 → trigger → AWS Lambda Function Creates a Thumbnail → push → New thumbnail in S3

AWS Lambda Function Creates a Thumbnail → push → Metadata in DynamoDB

Image name
Image size
Creation date
etc...
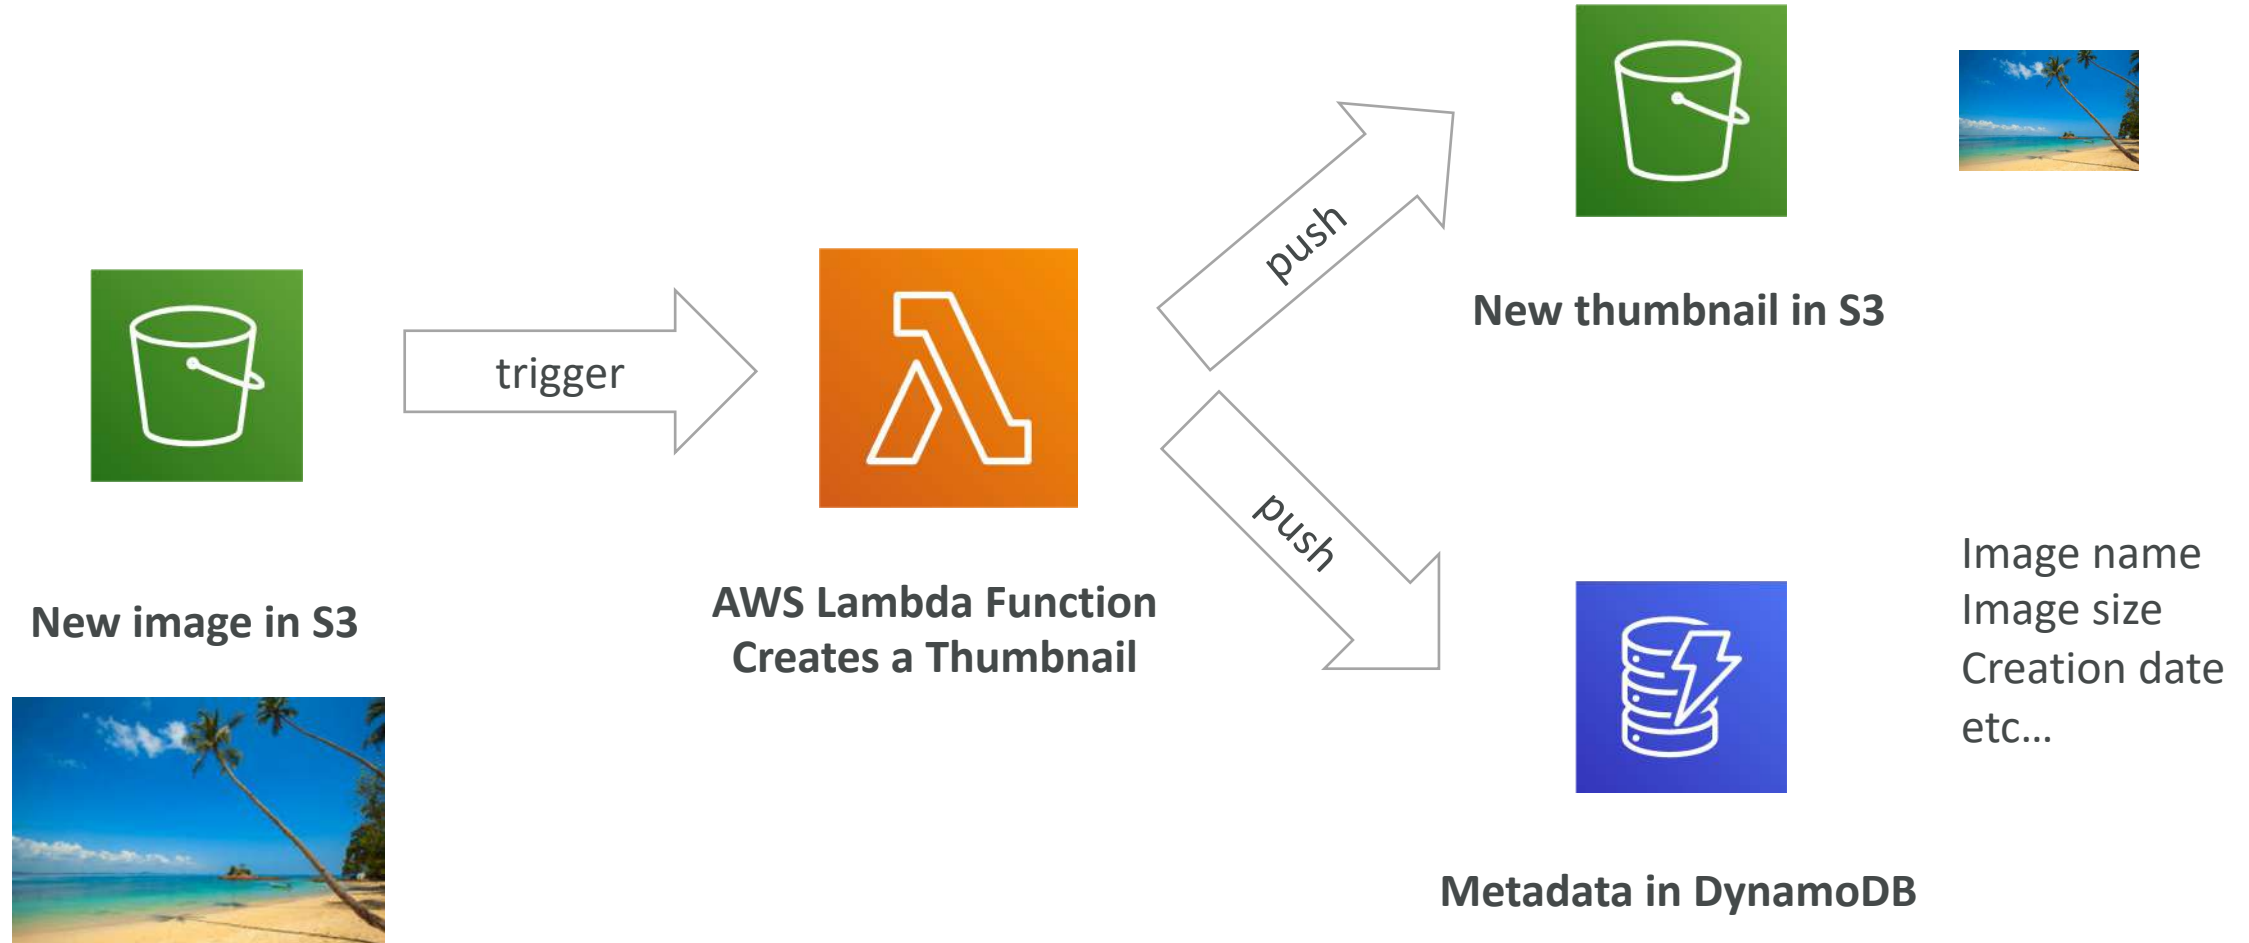

Example: Serverless CRON Job

**CloudWatch Events
EventBridge**

Trigger
Every 1 hour

**AWS Lambda Function
Perform a task**

AWS Lambda Pricing: example

- You can find overall pricing information here: https://aws.amazon.com/lambda/pricing/

- Pay per **calls**:
  - First 1,000,000 requests are free
  - $0.20 per 1 million requests thereafter ($0.0000002 per request)

- Pay per **duration**: (in increment of 1 ms)
  - 400,000 GB-seconds of compute time per month for FREE
  - == 400,000 seconds if function is 1GB RAM
  - == 3,200,000 seconds if function is 128 MB RAM
  - After that $1.00 for 600,000 GB-seconds

- It is usually <u>very cheap</u> to run AWS Lambda so it's <u>very popular</u>

CloudWatch Events / EventBridge

CRON or Rate EventBridge Rule

Trigger
Every 1 hour

AWS Lambda Function Perform a task

CodePipeline EventBridge Rule

Trigger on **State Changes**

AWS Lambda Function Perform a task
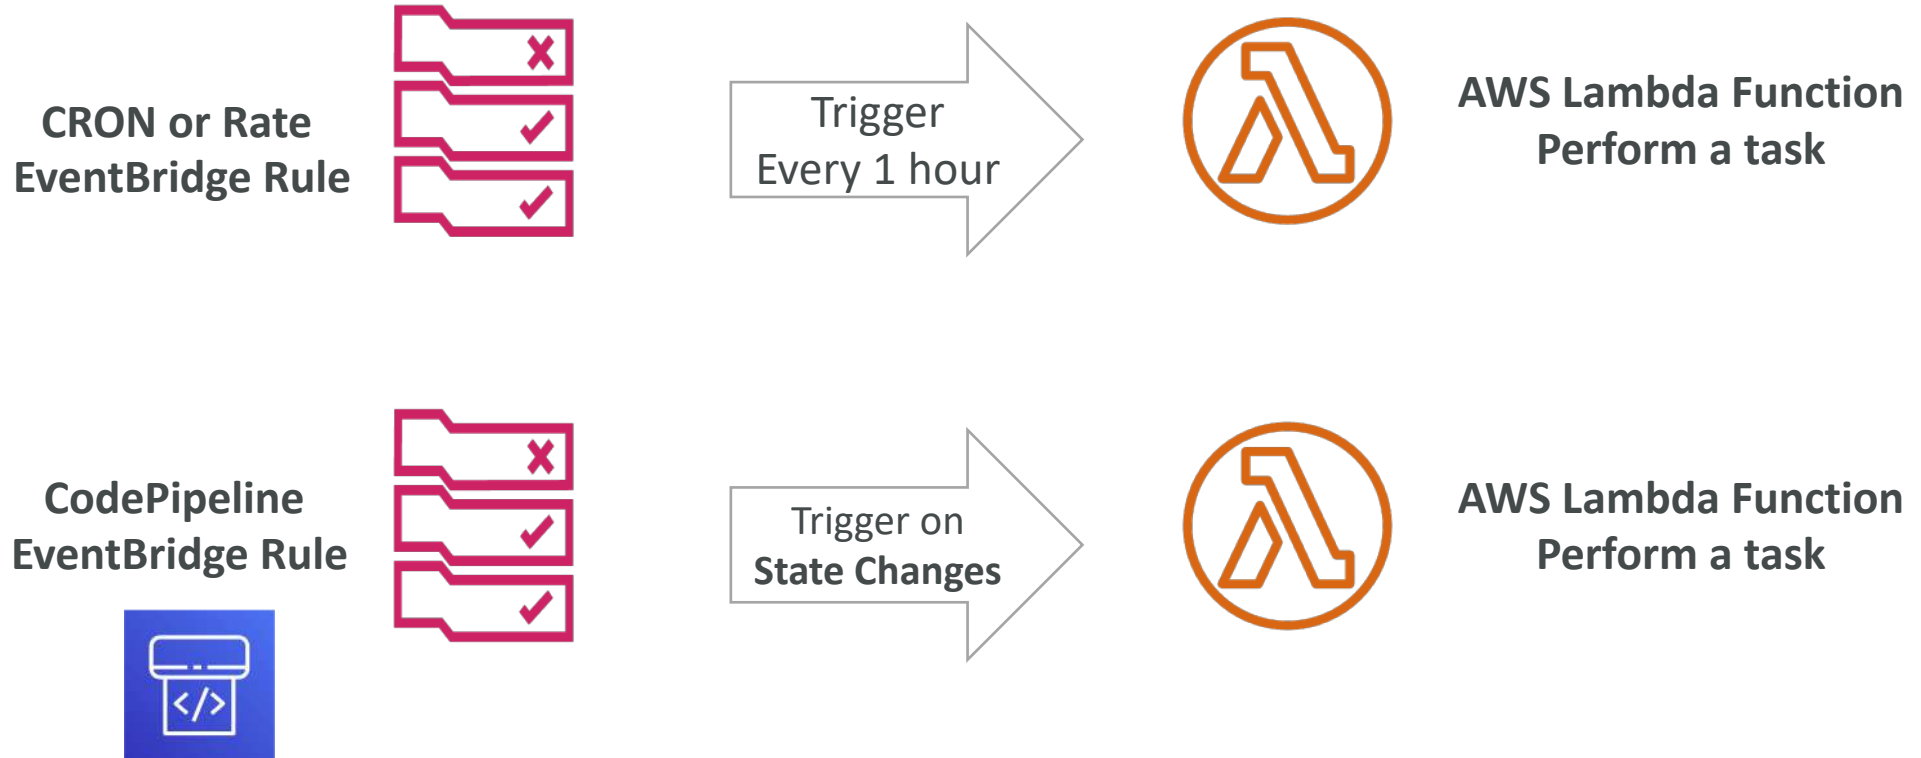

S3 Events Notifications

- S3:ObjectCreated, S3:ObjectRemoved, S3:ObjectRestore, S3:Replication…
- Object name filtering possible (*.jpg)
- Use case: generate thumbnails of images uploaded to S3

- S3 event notifications typically deliver events in seconds but can sometimes take a minute or longer
- If two writes are made to a single non-versioned object at the same time, it is possible that only a single event notification will be sent
- If you want to ensure that an event notification is sent for every successful write, you can enable versioning on your bucket.

events → Amazon S3

SNS → SQS, SQS

SQS → Lambda Function

async

Lambda Function → DLQ → SQS
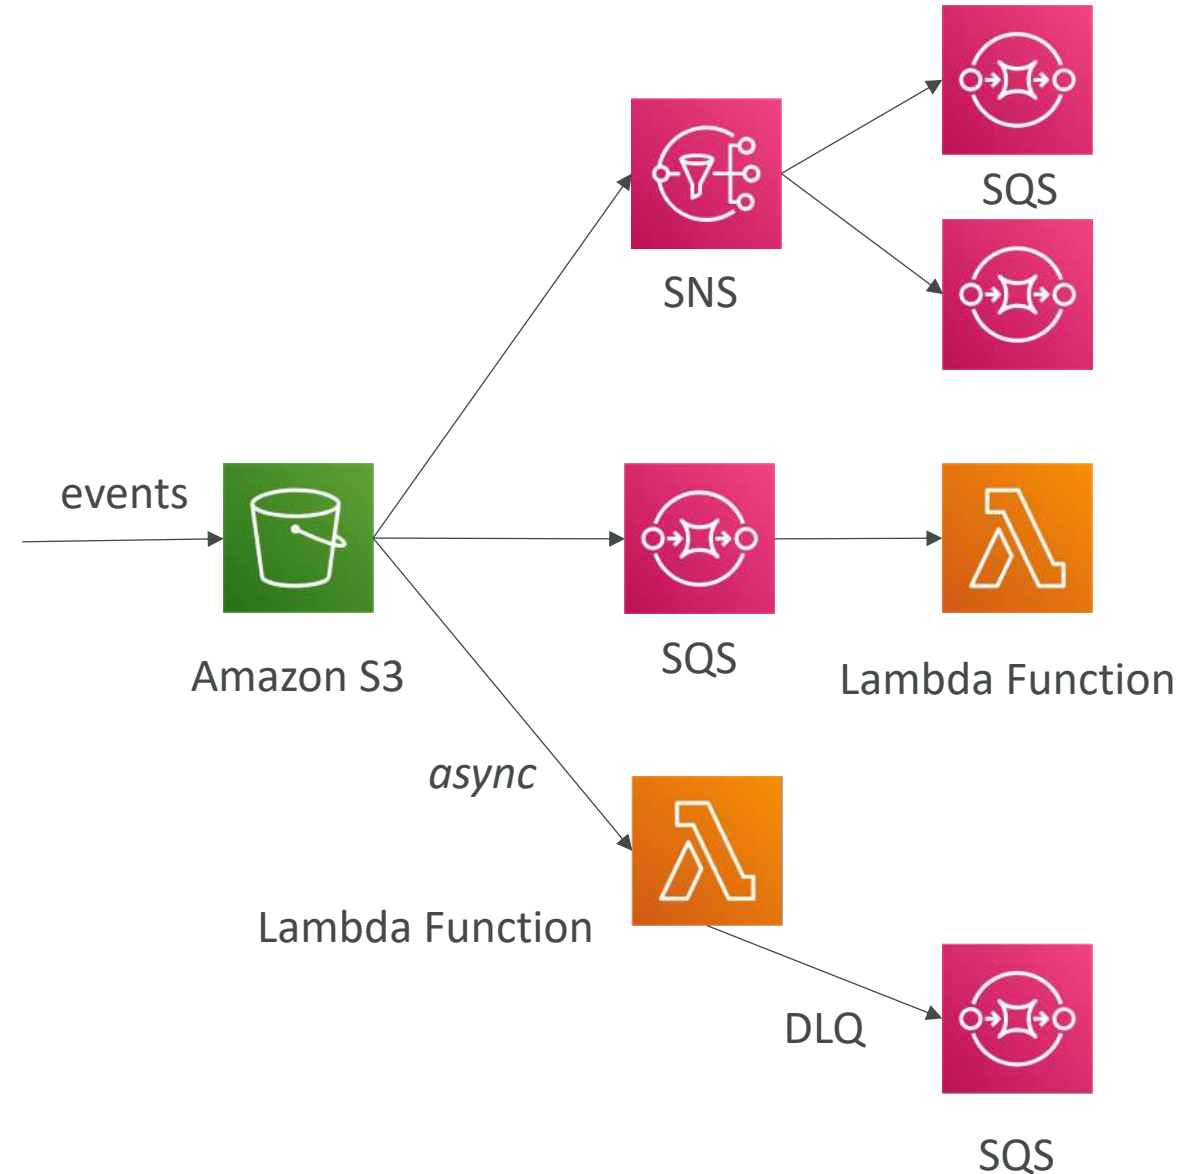

Simple S3 Event Pattern – Metadata Sync
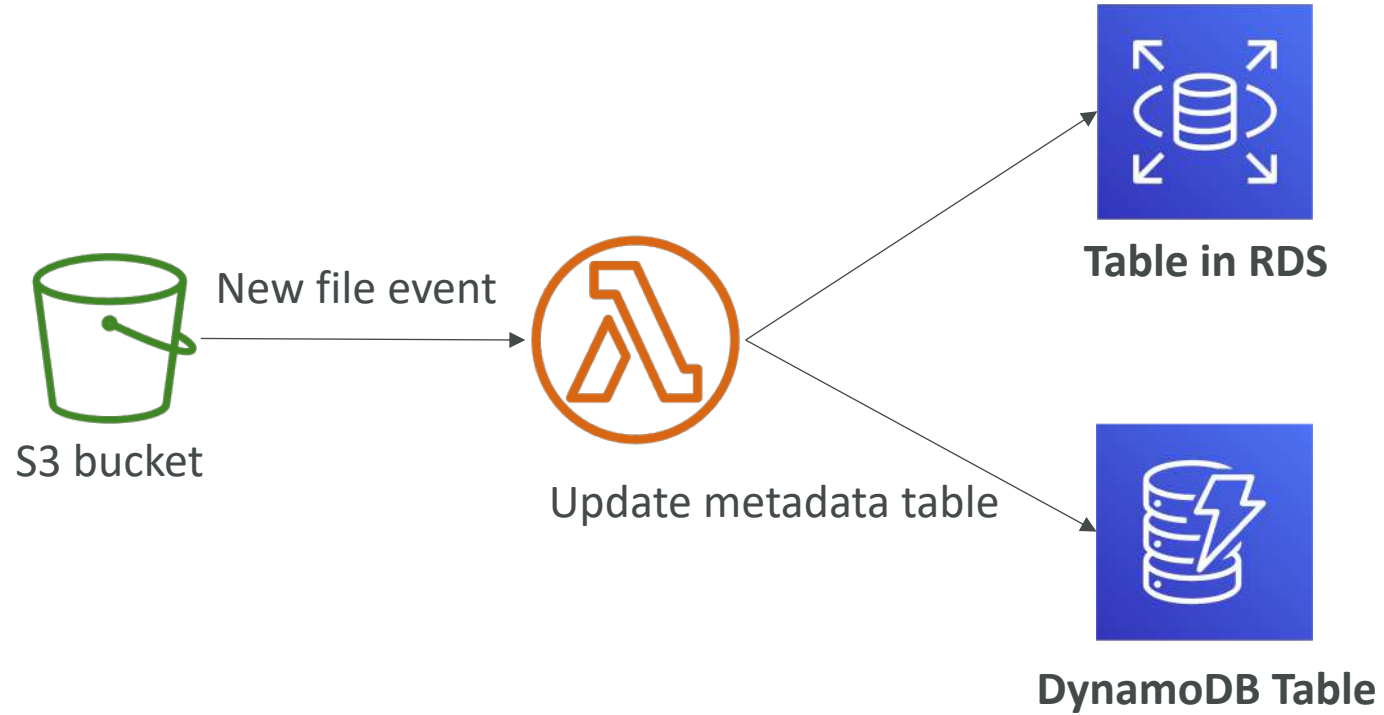

Lambda Execution Role (IAM Role)

- Grants the Lambda function permissions to AWS services / resources
- Sample managed policies for Lambda:
  - AWSLambdaBasicExecutionRole – Upload logs to CloudWatch.
  - AWSLambdaKinesisExecutionRole – Read from Kinesis
  - AWSLambdaDynamoDBExecutionRole – Read from DynamoDB Streams
  - AWSLambdaSQSQueueExecutionRole – Read from SQS
  - AWSLambdaVPCAccessExecutionRole – Deploy Lambda function in VPC
  - AWSXRayDaemonWriteAccess – Upload trace data to X-Ray.

- When you use an <u>event source mapping</u> to invoke your function, Lambda uses the execution role to read event data.
- Best practice: create one Lambda Execution Role per function

Lambda Resource Based Policies

- Use resource-based policies to give other accounts and AWS services permission to use your Lambda resources

- Similar to S3 bucket policies for S3 bucket

- An IAM principal can access Lambda:
  - if the IAM policy attached to the principal authorizes it (e.g. user access)
  - OR if the resource-based policy authorizes (e.g. service access)

- When an AWS service like Amazon S3 calls your Lambda function, the resource-based policy gives it access.

Lambda Logging & Monitoring

- CloudWatch Logs:
  - AWS Lambda execution logs are stored in AWS CloudWatch Logs
  - **Make sure your AWS Lambda function has an execution role with an IAM policy that authorizes writes to CloudWatch Logs**

- CloudWatch Metrics:
  - AWS Lambda metrics are displayed in AWS CloudWatch Metrics
  - Invocations, Durations, Concurrent Executions
  - Error count, Success Rates, Throttles
  - Async Delivery Failures
  - Iterator Age (Kinesis & DynamoDB Streams)

Lambda Tracing with X-Ray

- Enable in Lambda configuration (**Active Tracing**)

- Runs the X-Ray daemon for you

- Use AWS X-Ray SDK in Code

- Ensure Lambda Function has a correct IAM Execution Role
  - The managed policy is called AWSXRayDaemonWriteAccess

- Environment variables to communicate with X-Ray
  - _X_AMZN_TRACE_ID: contains the tracing header
  - AWS_XRAY_CONTEXT_MISSING: by default, LOG_ERROR
  - AWS_XRAY_DAEMON_ADDRESS: the X-Ray Daemon IP_ADDRESS:PORT

Lambda Function Configuration

- RAM:
  - From 128MB to 10GB in 1MB increments
  - The more RAM you add, the more vCPU credits you get
  - At 1,792 MB, a function has the equivalent of one full vCPU
  - After 1,792 MB, you get more than one CPU, and need to use multi-threading in your code to benefit from it (up to 6 vCPU)

- If your application is CPU-bound (computation heavy), increase RAM

- **Timeout:** default 3 seconds, maximum is 900 seconds (15 minutes)

Lambda Execution Context

- The execution context is a temporary runtime environment that initializes any external dependencies of your lambda code

- Great for database connections, HTTP clients, SDK clients…

- The execution context is maintained for some time in anticipation of another Lambda function invocation

- The next function invocation can "re-use" the context to execution time and save time in initializing connections objects

- The execution context includes the *tmp* directory

Initialize outside the handler

BAD!

```python
import os

def get_user_handler(event, context):

    DB_URL = os.getenv("DB_URL")
    db_client = db.connect(DB_URL)
    user = db_client.get(user_id = event["user_id"])

    return user
```

The DB connection is established
At every function invocation

GOOD!

```python
import os

DB_URL = os.getenv("DB_URL")
db_client = db.connect(DB_URL)

def get_user_handler(event, context):

    user = db_client.get(user_id = event["user_id"])

    return user
```

The DB connection is established once
And re-used across invocations

Lambda Functions /tmp space

- If your Lambda function needs to download a big file to work...
- If your Lambda function needs disk space to perform operations...
- You can use the /tmp directory
- Max size is 10GB
- The directory content remains when the execution context is frozen, providing transient cache that can be used for multiple invocations (helpful to checkpoint your work)
- For permanent persistence of object (non temporary), use S3
- To encrypt content on /tmp, you must generate KMS Data Keys

Lambda Concurrency and Throttling

- Concurrency limit: up to 1000 concurrent executions
- Can set a "**reserved concurrency**" at the function level (=limit)

- Each invocation over the concurrency limit will trigger a "Throttle"

- Throttle behavior:
  - If synchronous invocation => return ThrottleError - 429
  - If asynchronous invocation => retry automatically and then go to DLQ

- If you need a higher limit, open a support ticket

Lambda Concurrency Issue

- If you don't reserve (=limit) concurrency, the following can happen:

Many users

Application Load Balancer

1000 concurrent executions

Few users

API Gateway

THROTTLE!

SDK / CLI
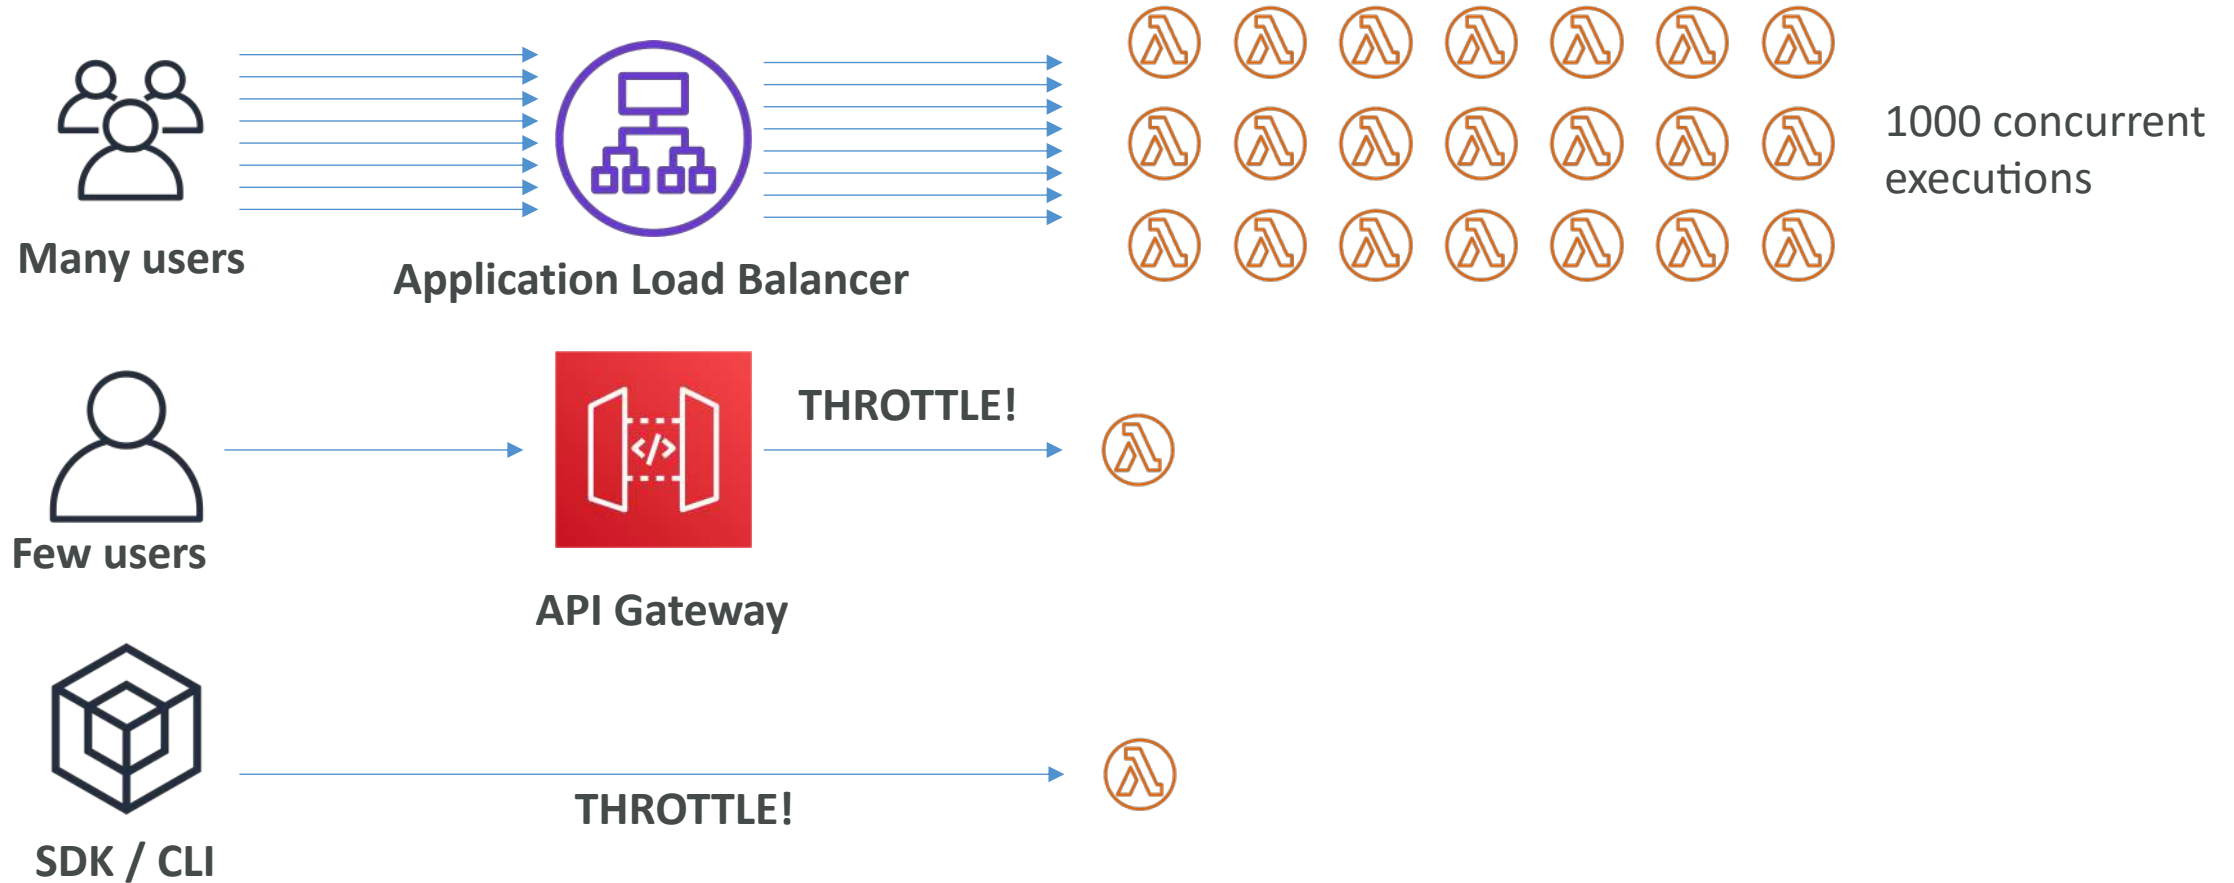

THROTTLE!

Concurrency and Asynchronous Invocations

New file event

New file event

S3 bucket

New file event
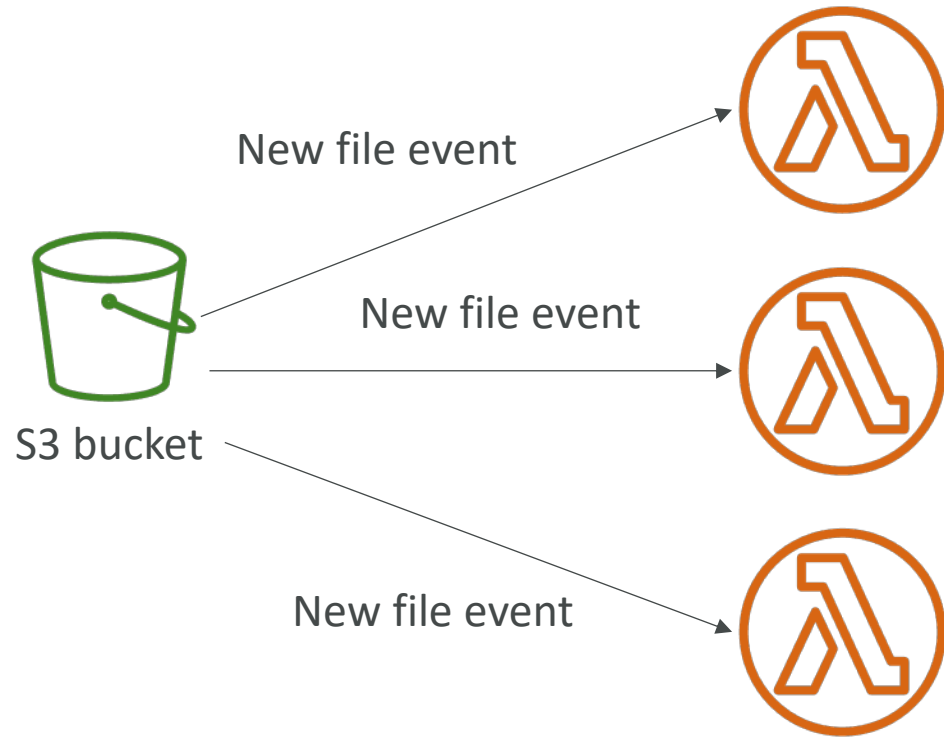

- If the function doesn't have enough concurrency available to process all events, additional requests are throttled.

- For throttling errors (429) and system errors (500-series), Lambda returns the event to the queue and attempts to run the function again for up to 6 hours.

- The retry interval increases exponentially from 1 second after the first attempt to a maximum of 5 minutes.

Cold Starts & Provisioned Concurrency

- Cold Start:
  - New instance => code is loaded and code outside the handler run (init)
  - If the init is large (code, dependencies, SDK…) this process can take some time.
  - First request served by new instances has higher latency than the rest

- Provisioned Concurrency:
  - Concurrency is allocated before the function is invoked (in advance)
  - So the cold start never happens and all invocations have low latency
  - Application Auto Scaling can manage concurrency (schedule or target utilization)

- Note:
  - Note: cold starts in VPC have been dramatically reduced in Oct & Nov 2019
  - https://aws.amazon.com/blogs/compute/announcing-improved-vpc-networking-for-aws-lambda-functions/

Reserved and Provisioned Concurrency
www.datacumulus.com

https://docs.aws.amazon.com/lambda/latest/dg/configuration-concurrency.html
Lambda Monitoring – CloudWatch Metrics

- **Invocations** – number of times your function is invoked (success/failure)
- **Duration** – amount of time your function spends processing an event
- **Errors** – number of invocations that result in a function error
- **Throttles** – number of invocation requests that are throttled (no concurrency available)
- **DeadLetterErrors** – number of times Lambda failed to send an event to a DLQ (async invocations)
- **IteratorAge** – time between when a Stream receives a record and when the Event Source Mapping sends the event to the function (for Event Source Mapping that reads from Stream)
- **ConcurrentExecutions** – number of function instances that are processing events

Example Lambda Metrics Dashboard
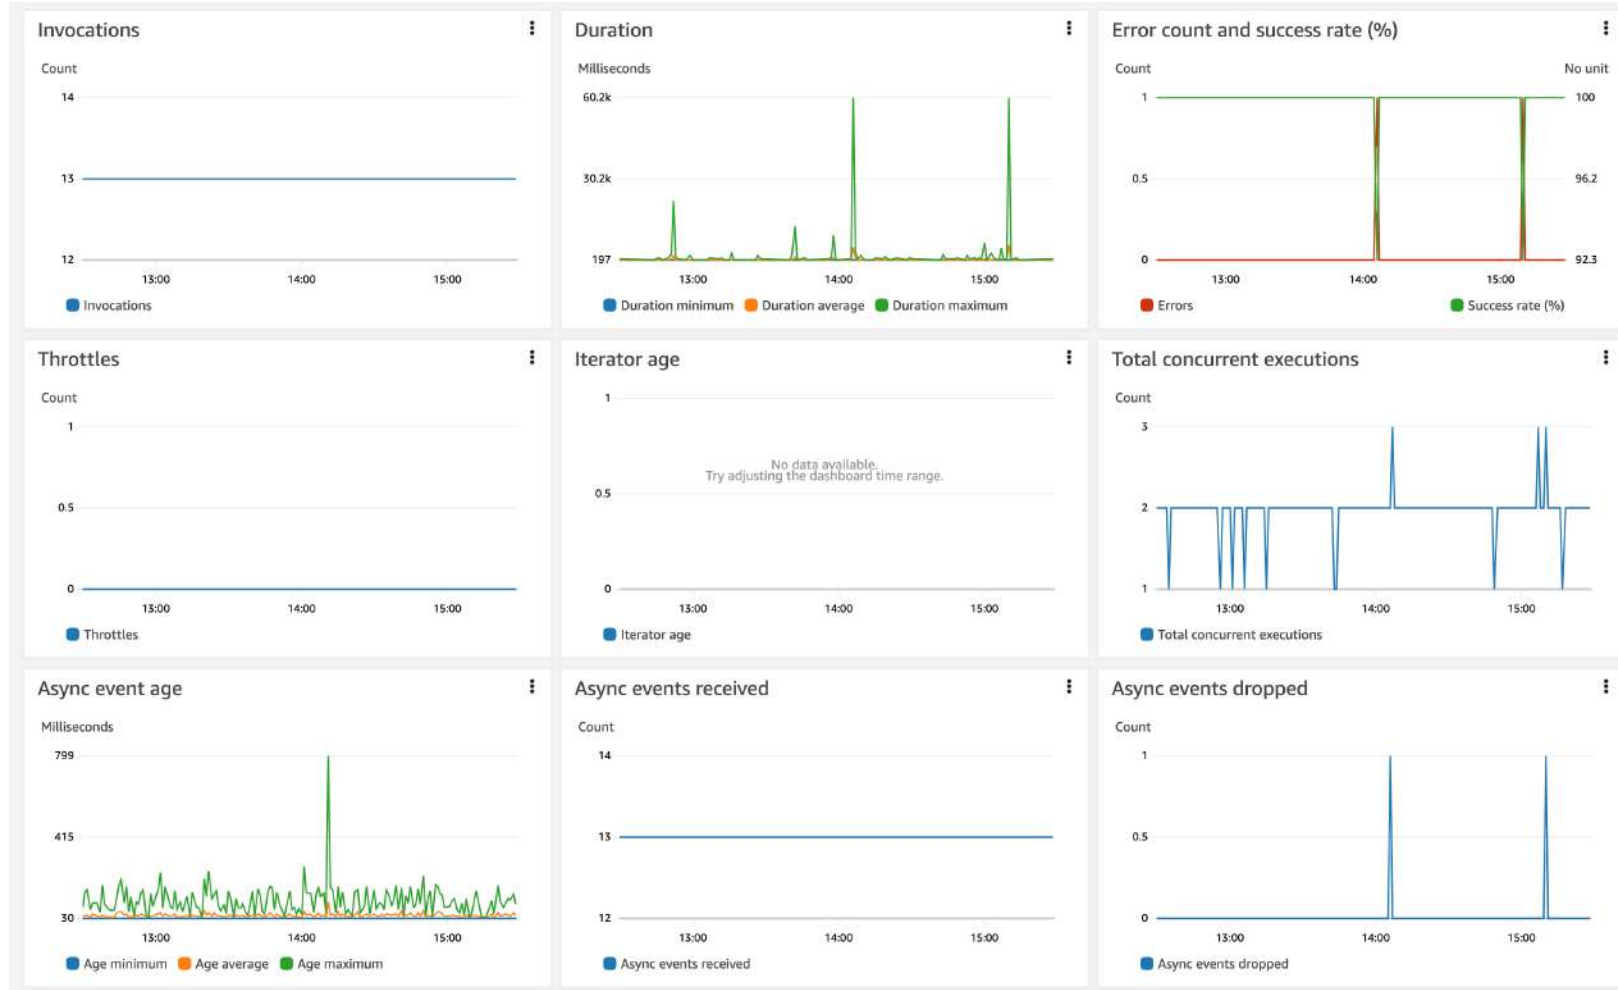

Lambda Monitoring – CloudWatch Alarms

- **Example 1** – No Lambda Invocations in the last hour using **Invocations** CloudWatch Metric

- **Example 2** – When **error > 0** using **Errors** CloudWatch Metric

- **Example 3** – When throttles > 0 using **Throttles** CloudWatch Metric

Lambda Monitoring – CloudWatch Logs

```json
{
    "Version": "2012-10-17",

Log Streams

Lambda Monitoring – CloudWatch Logs Insights

- Allows you to search through all your Lambda functions logs

```
1   fields @timestamp, @message
2   | filter @message like /ERROR/
3   | sort @timestamp desc
```

Example: How many times Lambda function
had errors in the last 7 days

Lambda Monitoring – CloudWatch Logs Insights

Example CloudWatch Logs Insights Queries

Query	Description
fields Timestamp, LogLevel, Message | filter LogLevel == "ERR" | sort @timestamp desc | limit 100	The last 100 errors
filter @type = "REPORT" | stats sum(strcontains(@message, "Init Duration"))/count(*) * 100 as coldStartPct, avg(@duration)by bin(5m)	Percentage of cold starts in total invocations
filter @type = "REPORT" and @maxMemoryUsed=@memorySize | statscount_distinct(@requestId) by bin(30m)	Invocations using 100% of assigned memory
avgMemoryUsedPERC,avg(@billedDuration) as avgDurationMSby bin(5m)	Average memory used across invocations
filter @message like /Task timed out/ | stats count() by bin(30m)	Invocations that timed out

Lambda Monitoring – Lambda Insights

- Collects, aggregates, and summarizes:
  - **System-level Metrics** – CPU time, memory, disk, network
  - **Diagnostic Information** – cold starts, Lambda worker shutdowns
- Helps you isolate issues with your Lambda functions and resolve them quickly
- Uses a CloudWatch Lambda Extension (provided as a Lambda layer)

```

Amazon EC2 Storage & Data Management

EBS, Instance Store & EFS

What's an EBS Volume?

- An EBS (Elastic Block Store) Volume is a network drive you can attach to your instances while they run

- It allows your instances to persist data, even after their termination

- **They can only be mounted to one instance at a time** (at the CCP level)

- They are bound to **a specific availability zone**

- Analogy: Think of them as a "network USB stick"

- Free tier: 30 GB of free EBS storage of type General Purpose (SSD) or Magnetic per month

EBS Volume

- It's a network drive (i.e. not a physical drive)
  - It uses the network to communicate the instance, which means there might be a bit of latency
  - It can be detached from an EC2 instance and attached to another one quickly

- It's locked to an Availability Zone (AZ)
  - An EBS Volume in us-east-1a cannot be attached to us-east-1b
  - To move a volume across, you first need to snapshot it

- Have a provisioned capacity (size in GBs, and IOPS)
  - You get billed for all the provisioned capacity
  - You can increase the capacity of the drive over time

EBS Volume - Example
EC2 Instance Store
- EBS volumes are **network drives** with good but "limited" performance
- <u>**If you need a high-performance hardware disk, use EC2 Instance Store**</u>

- Better I/O performance
- EC2 Instance Store lose their storage if they're stopped (ephemeral)
- Good for buffer / cache / scratch data / temporary content
- Risk of data loss if hardware fails
- Backups and Replication are your responsibility

Local EC2 Instance Store

Very high IOPS

Instance Size	100% Random Read IOPS	Write IOPS
i3.large *	100,125	35,000
i3.xlarge *	206,250	70,000
i3.2xlarge	412,500	180,000
i3.4xlarge	825,000	360,000
i3.8xlarge	1.65 million	720,000
i3.16xlarge	3.3 million	1.4 million
i3.metal	3.3 million	1.4 million
i3en.large *	42,500	32,500
i3en.xlarge *	85,000	65,000
i3en.2xlarge *	170,000	130,000
i3en.3xlarge	250,000	200,000
i3en.6xlarge	500,000	400,000
i3en.12xlarge	1 million	800,000
i3en.24xlarge	2 million	1.6 million
i3en.metal	2 million	1.6 million

EBS Volume Types

- EBS Volumes come in 6 types
  - **gp2 / gp3 (SSD)**: General purpose SSD volume that balances price and performance for a wide variety of workloads
  - **io1 / io2 Block Express (SSD)**: Highest-performance SSD volume for mission-critical low-latency or high-throughput workloads
  - **st1 (HDD)**: Low cost HDD volume designed for frequently accessed, throughput-intensive workloads
  - **sc1 (HDD)**: Lowest cost HDD volume designed for less frequently accessed workloads

- EBS Volumes are characterized in Size | Throughput | IOPS (I/O Ops Per Sec)
- When in doubt always consult the AWS documentation – it's good!
- Only gp2/gp3 and io1/io2 Block Express can be used as boot volumes

EBS Volume Types Use cases
General Purpose SSD

- Cost effective storage, low-latency

- System boot volumes, Virtual desktops, Development and test environments

- 1 GiB - 16 TiB

- gp3:
  - Baseline of 3,000 IOPS and throughput of 125 MiB/s
  - Can increase IOPS up to 16,000 and throughput up to 1000 MiB/s independently

- gp2:
  - Small gp2 volumes can burst IOPS to 3,000
  - Size of the volume and IOPS are linked, max IOPS is 16,000
  - 3 IOPS per GB, means at 5,334 GB we are at the max IOPS

EBS Volume Types Use cases
Provisioned IOPS (PIOPS) SSD

- Critical business applications with sustained IOPS performance

- Or applications that need more than 16,000 IOPS

- Great for **databases workloads** (sensitive to storage perf and consistency)

- io1 (4 GiB - 16 TiB):
  - Max PIOPS: 64,000 for Nitro EC2 instances & 32,000 for other
  - Can increase PIOPS independently from storage size

- io2 Block Express (4 GiB – 64 TiB):
  - Sub-millisecond latency
  - Max PIOPS: 256,000 with an IOPS:GiB ratio of 1,000:1

- Supports EBS Multi-attach

EBS Volume Types Use cases
Hard Disk Drives (HDD)

- Cannot be a boot volume

- 125 GiB to 16 TiB

- Throughput Optimized HDD (st1)
  - Big Data, Data Warehouses, Log Processing
  - **Max throughput** 500 MiB/s – max IOPS 500

- Cold HDD (sc1):
  - For data that is infrequently accessed
  - Scenarios where lowest cost is important
  - **Max throughput** 250 MiB/s – max IOPS 250

EBS – Volume Types Summary

	General Purpose SSD volumes		Provisioned IOPS SSD volumes	
Volume type	gp3	gp2	io2 Block Express 3	io1
Durability	99.8% - 99.9% durability (0.1% - 0.2% annual failure rate)		99.999% durability (0.001% annual failure rate)	99.8% - 99.9% durability (0.1% - 0.2% annual failure rate)
Use cases	• Transactional workloads • Virtual desktops • Medium-sized, single-instance databases • Low-latency interactive applications • Boot volumes • Development and test environments		Workloads that require: • Sub-millisecond latency • Sustained IOPS performance • More than 64,000 IOPS or 1,000 MiB/s of throughput	• Workloads that require sustained IOPS performance or more than 16,000 IOPS • I/O-intensive database workloads
Volume size	1 GiB - 16 TiB		4 GiB - 64 TiB 4	4 GiB - 16 TiB
Max IOPS per volume (16 KiB I/O)	16,000		256,000 5	64,000
Max throughput per volume	1,000 MiB/s	250 MiB/s 1	4,000 MiB/s	1,000 MiB/s 2
Amazon EBS Multi-attach	Not supported		Supported	
NVMe reservations	Not supported		Supported	Not supported
Boot volume	Supported			

	Throughput Optimized HDD volumes	Cold HDD volumes
Volume type	st1	sc1
Durability	99.8% - 99.9% durability (0.1% - 0.2% annual failure rate)	
Use cases	• Big data • Data warehouses • Log processing	• Throughput-oriented storage for data that is infrequently accessed • Scenarios where the lowest storage cost is important
Volume size	125 GiB - 16 TiB	
Max IOPS per volume (1 MiB I/O)	500	250
Max throughput per volume	500 MiB/s	250 MiB/s
Amazon EBS Multi-attach	Not supported	
Boot volume	Not supported	

https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ebs-volume-types.html#solid-state-drives

EBS Multi-Attach – io1/io2 family

- Attach the same EBS volume to multiple EC2 instances in the same AZ

- Each instance has full read & write permissions to the high-performance volume

- Use case:
  - Achieve **higher application availability** in clustered Linux applications (ex: Teradata)
  - Applications must manage concurrent write operations

- Up to 16 EC2 Instances at a time

- Must use a file system that's cluster-aware (not XFS, EXT4, etc…)

Availability Zone 1

io2 volume with Multi-Attach
EBS Volume Resizing

- You can only increase the EBS volumes:
    - Size (any volume type)
    - IOPS (only in IO1)

- After resizing an EBS volume, you need to repartition your drive

- After increasing the size, it's possible for the volume to be in a long time in the "optimisation" phase. The volume is still usable

- You can't decrease the size of your EBS volume (create another smaller volume then migrate data)

EBS Volume
(250 GiB)

Modifying

Optimizing

Completed

EBS Volume
(1 TiB)

250 | 750GB

repartition
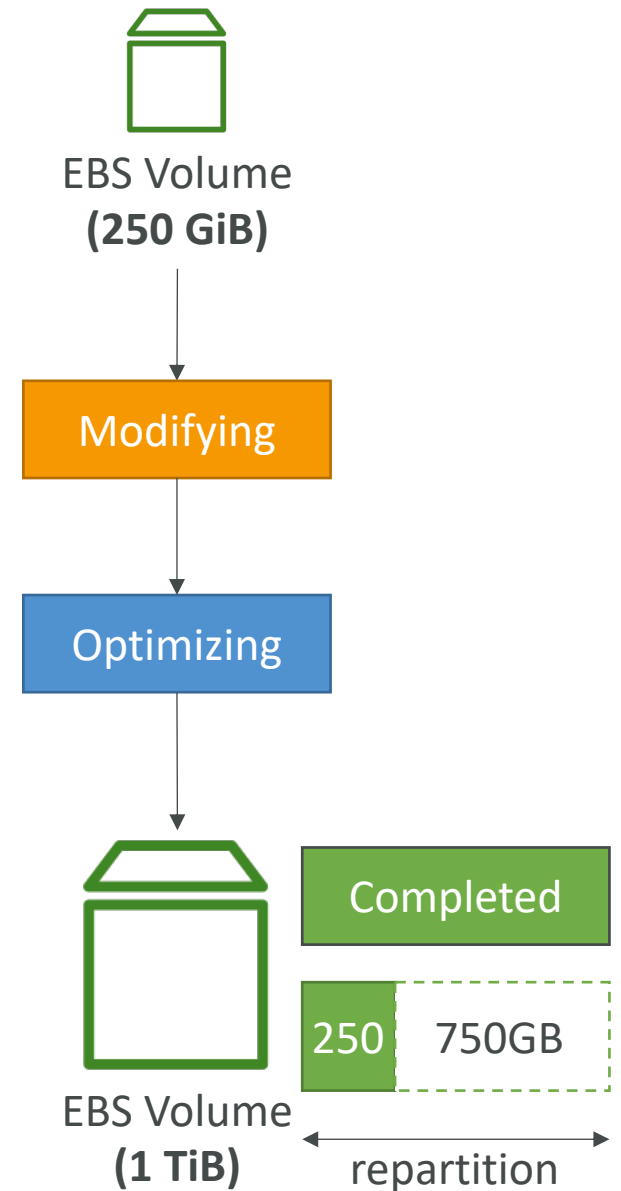

EBS Snapshots

- Make a backup (snapshot) of your EBS volume at a point in time
- Not necessary to detach volume to do snapshot, but recommended
- Can copy snapshots across AZ or Region
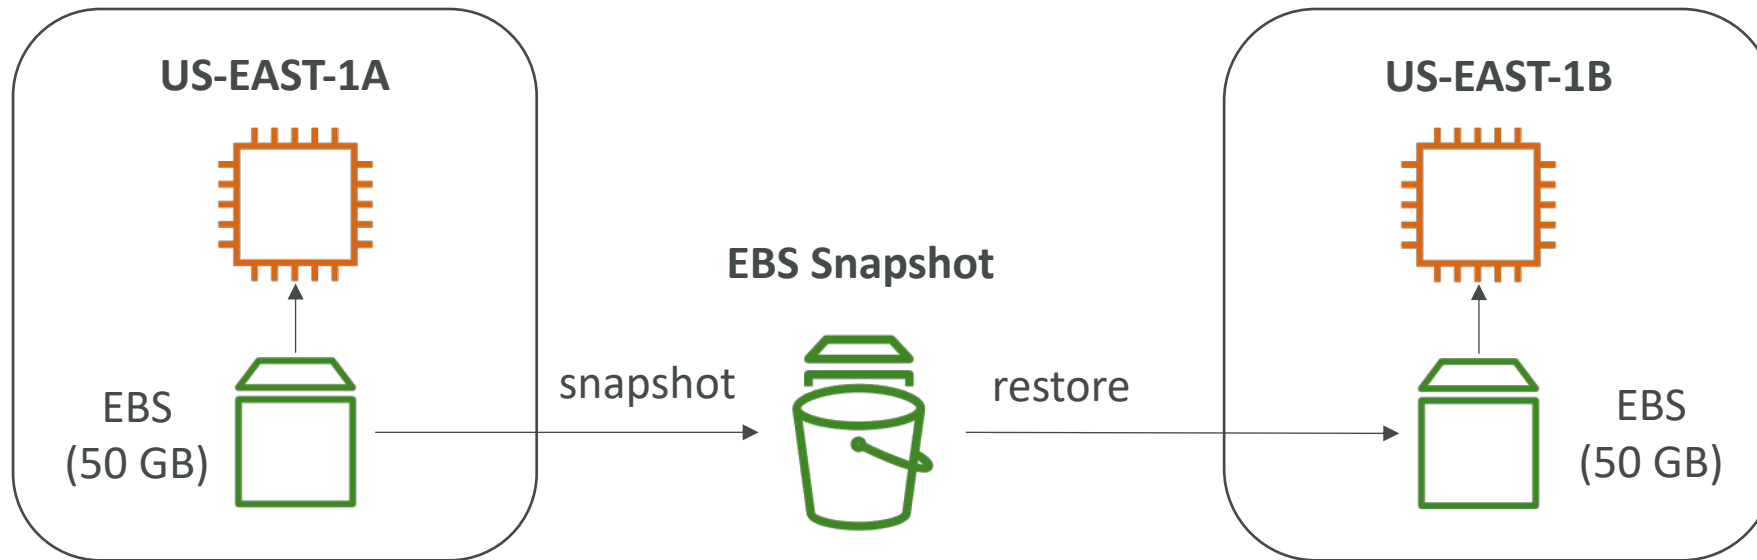

Amazon Data Lifecycle Manager

- Automate the creation, retention, and deletion of EBS snapshots and EBS-backed AMIs

- Schedule backups, cross-account snapshot copies, delete outdated backups, …

- Uses resource tags to identify the resources (EC2 instances, EBS volumes)

- Can't be used to manage snapshots/AMIs created outside DLM

- Can't be used to manage instance-store backed AMIs

EBS Volume

EBS Volumes

Amazon Data Lifecycle Manager

Snapshots

AMI
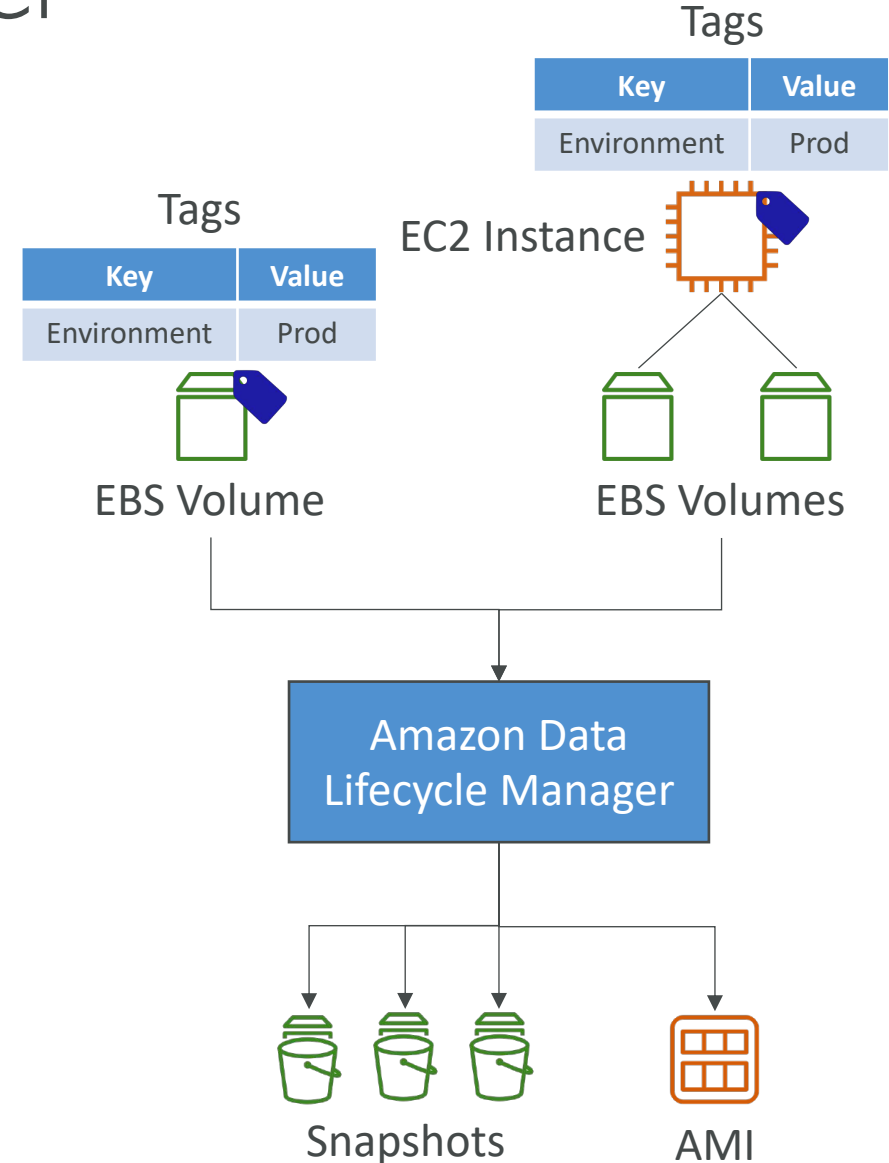

EBS Snapshots – Fast Snapshot Restore (FSR)

- EBS Snapshots stored in S3
- By default, there's a latency of I/O operations the first time each block is accessed (block must be pulled from S3)
- **Solution:** force the initialization of the entire volume (using the *dd* or *fio* command), or you can enable FSR

- FSR helps you to create a volume from a snapshot that is fully initialized at creation (no I/O latency)
- Enabled for a snapshot in a particular AZ (billed per minute – very expensive $$$)
- Can be enabled on snapshots created by Data Lifecycle Manager

Amazon S3

EBS Snapshot   EBS Snapshot
                (FSR enabled)

storage
blocks   restore

EBS Volume   EBS Volume
EBS Snapshots Features

- EBS Snapshot Archive
  - Move a Snapshot to an ''archive tier'' that is 75% cheaper
  - Takes within 24 to 72 hours for restoring the archive

- Recycle Bin for EBS Snapshots
  - Setup rules to retain deleted snapshots so you can recover them after an accidental deletion
  - Specify retention (from 1 day to 1 year)

EBS Snapshot → archive → **EBS Snapshot Archive**

EBS Snapshot → delete → **Recycle Bin**
EBS Migration

- EBS Volumes are only locked to a specific AZ

- To migrate it to a different AZ (or region):
    - Snapshot the volume
    - (optional) Copy the volume to a different region
    - Create a volume from the snapshot in the AZ of your choice

- Let's practice!

EBS Encryption

- When you create an encrypted EBS volume, you get the following:
  - Data at rest is encrypted inside the volume
  - All the data in flight moving between the instance and the volume is encrypted
  - All snapshots are encrypted
  - All volumes created from the snapshot
- Encryption and decryption are handled transparently (you have nothing to do)
- Encryption has a minimal impact on latency
- EBS Encryption leverages keys from KMS (AES-256)
- Copying an unencrypted snapshot allows encryption
- Snapshots of encrypted volumes are encrypted

Encryption: encrypt an unencrypted EBS volume

- Create an EBS snapshot of the volume

- Encrypt the EBS snapshot (using copy)

- Create new ebs volume from the snapshot (the volume will also be encrypted)

- Now you can attach the encrypted volume to the original instance

Amazon EFS – Elastic File System

- Managed NFS (network file system) that can be mounted on many EC2
- EFS works with EC2 instances in multi-AZ
- Highly available, scalable, expensive (3x gp2), pay per use
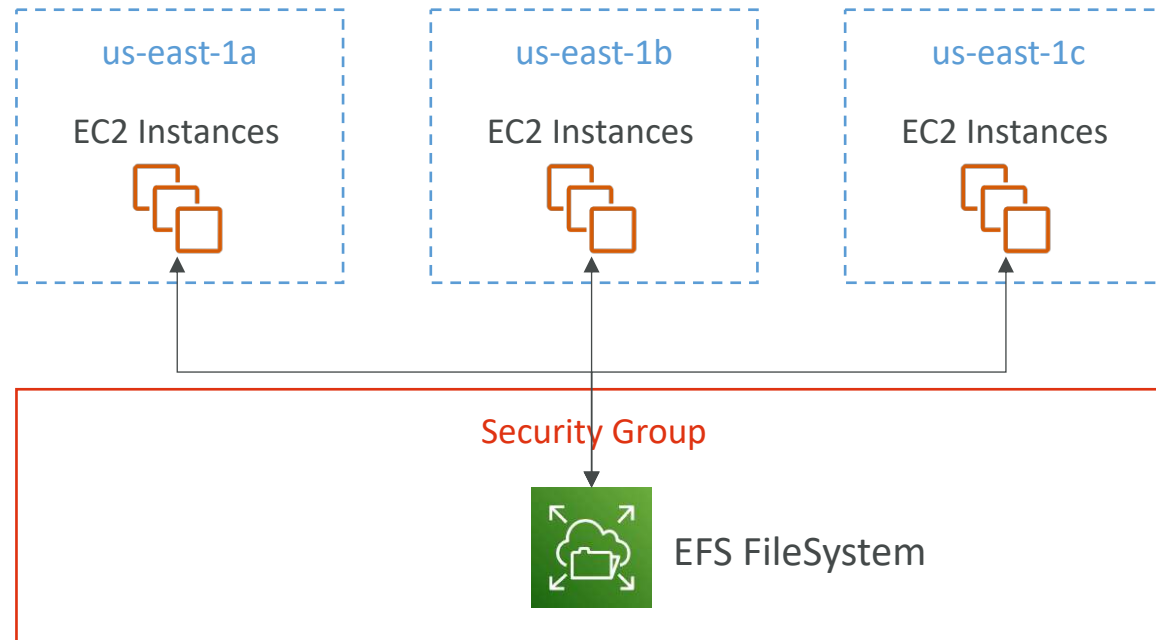

Amazon EFS – Elastic File System

- Use cases: content management, web serving, data sharing, Wordpress

- Uses NFSv4.1 protocol

- Uses security group to control access to EFS

- **Compatible with Linux based AMI (not Windows)**

- Encryption at rest using KMS

- POSIX file system (~Linux) that has a standard file API

- File system scales automatically, pay-per-use, no capacity planning!

EFS – Performance & Storage Classes

- EFS Scale
  - 1000s of concurrent NFS clients, 10 GB+ /s throughput
  - Grow to Petabyte-scale network file system, automatically

- Performance Mode (set at EFS creation time)
  - **General Purpose (default)** – latency-sensitive use cases (web server, CMS, etc…)
  - **Max I/O** – higher latency, throughput, highly parallel (big data, media processing)

- Throughput Mode
  - **Bursting** – 1 TB = 50MiB/s + burst of up to 100MiB/s
  - **Provisioned** – set your throughput regardless of storage size, ex: 1 GiB/s for 1 TB storage
  - **Elastic** – automatically scales throughput up or down based on your workloads
    - Up to 3GiB/s for reads and 1GiB/s for writes
    - Used for unpredictable workloads

EFS – Storage Classes

- Storage Tiers (lifecycle management feature – move file after N days)
  - Standard: for frequently accessed files
  - Infrequent access (EFS-IA): cost to retrieve files, lower price to store.
  - Archive: rarely accessed data (few times each year), 50% cheaper
  - Implement lifecycle policies to move files between storage tiers

- Availability and durability
  - Standard: Multi-AZ, great for prod
  - One Zone: One AZ, great for dev, backup enabled by default, compatible with IA (EFS One Zone-IA)

- Over 90% in cost savings

no access
for 60 days

EFS Standard

move

Lifecycle Policy

EFS IA

Amazon EFS File System
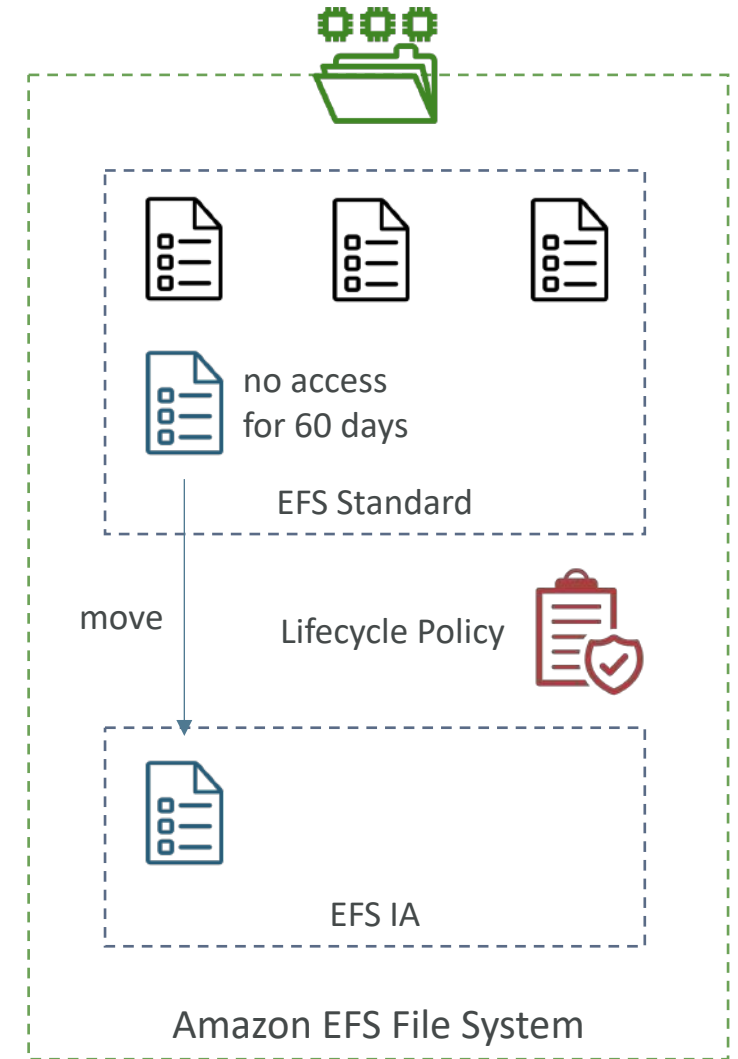

EBS vs EFS – Elastic Block Storage

- EBS volumes…
  - one instance (except multi-attach io1/io2)
  - are locked at the Availability Zone (AZ) level
  - gp2: IO increases if the disk size increases
  - gp3 & io1: can increase IO independently
- To migrate an EBS volume across AZ
  - Take a snapshot
  - Restore the snapshot to another AZ
  - EBS backups use IO and you shouldn't run them while your application is handling a lot of traffic
- Root EBS Volumes of instances get terminated by default if the EC2 instance gets terminated. (you can disable that)

Availability Zone 1

Availability Zone 2

EBS

EBS

snapshot

restore

EBS Snapshot
EBS vs EFS – Elastic File System

- Mounting 100s of instances across AZ
- EFS share website files (WordPress)
- Only for Linux Instances (POSIX)

- EFS has a higher price point than EBS
- Can leverage Storage Tiers for cost savings

- Remember: EFS vs EBS vs Instance Store

Availability Zone 1

Linux

EFS
Mount
Target

Availability Zone 2

Linux

EFS
Mount
Target

EFS
EFS – Access Points

- Easily manage applications access to NFS environments

- Enforce a POSIX user and group to use when accessing the file system

- Restrict access to a directory within the file system and optionally specify a different root directory

- Can restrict access from NFS clients using IAM policies

EFS File System
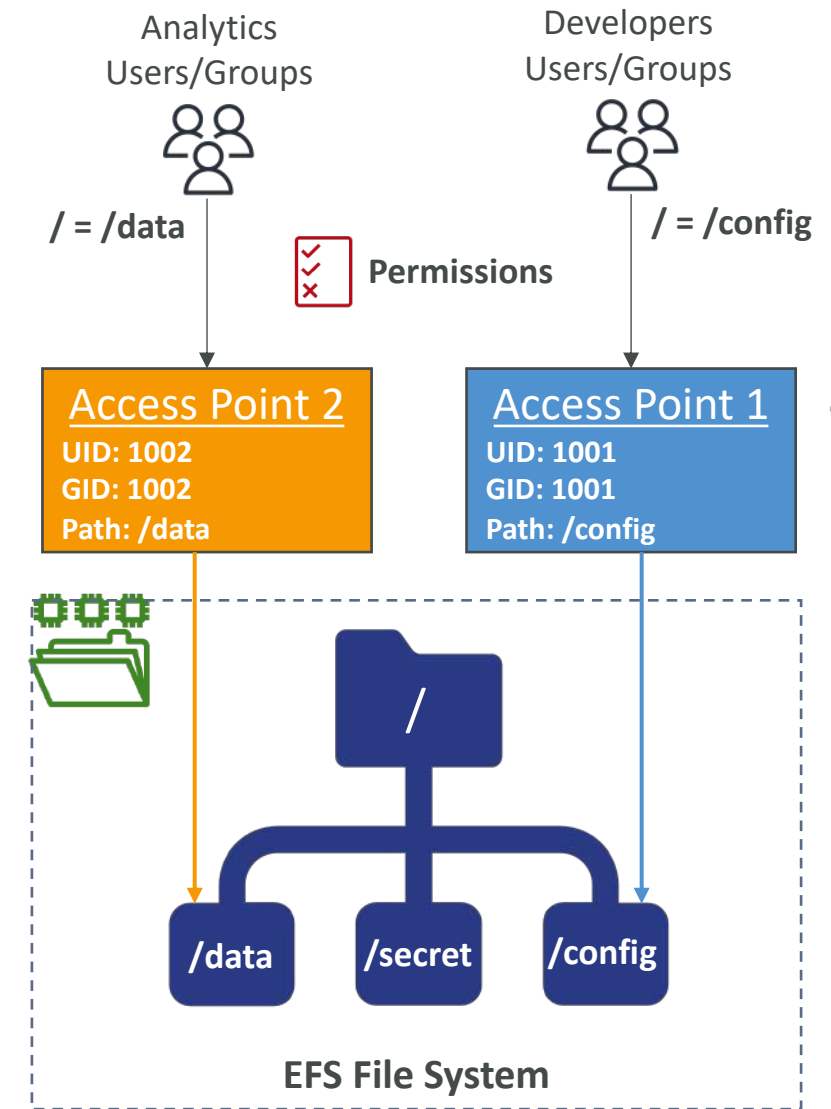

EFS - Operations

- Operations that can be done in place:
  - Lifecycle Policy (enable IA or change IA settings)
  - Throughput Mode and Provisioned Throughput Numbers
  - EFS Access Points
- Operations that require a migration using DataSync (replicates all file attributes and metadata)
  - Migration to encrypted EFS
  - Performance Mode (e.g. Max IO)

EFS File System (source)

AWS DataSync

EFS File System (destination - encrypted)
EFS – CloudWatch Metrics

- PercentIOLimit
  - How close the file system reaching the I/O limit (General Purpose)
  - If at 100%, move to Max I/O (migration)

- BurstCreditBalance
  - The number of burst credits the file system can use to achieve higher throughput levels

- StorageBytes
  - File system's size in bytes (15 minutes interval)
  - Dimensions: Standard, IA, Total (Standard + IA)

Throughput utilization (%)
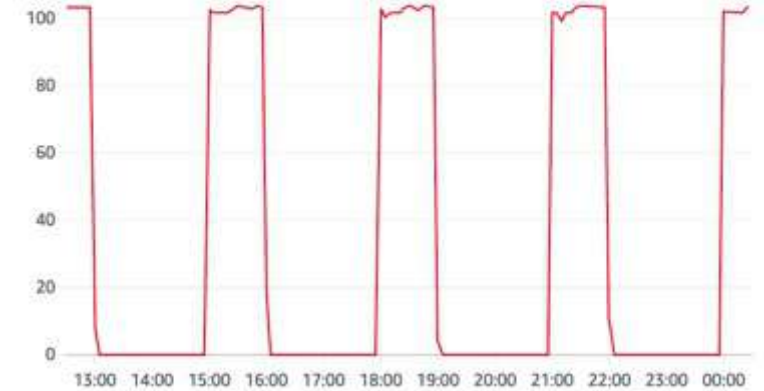

Burst Credit balance

Amazon S3

Section introduction

- Amazon S3 is one of the main building blocks of AWS

- It's advertised as ''infinitely scaling'' storage

- Many websites use Amazon S3 as a backbone

- Many AWS services use Amazon S3 as an integration as well

- We'll have a step-by-step approach to S3

Amazon S3 Use cases

- Backup and storage
- Disaster Recovery
- Archive
- Hybrid Cloud storage
- Application hosting
- Media hosting
- Data lakes & big data analytics
- Software delivery
- Static website

Nasdaq

Nasdaq stores 7 years of data into S3 Glacier

Sysco®

Sysco runs analytics on its data and gain business insights

Amazon S3 - Buckets

- Amazon S3 allows people to store objects (files) in "buckets" (directories)
- Buckets must have a **globally unique name (across all regions all accounts)**
- Buckets are defined at the region level
- S3 looks like a global service but buckets are created in a region
- Naming convention
  - No uppercase, No underscore
  - 3-63 characters long
  - Not an IP
  - Must start with lowercase letter or number
  - Must NOT start with the prefix **xn--**
  - Must NOT end with the suffix **-s3alias**

S3 Bucket

Amazon S3 - Objects

- Objects (files) have a Key
- The key is the FULL path:
  - s3://my-bucket/my_file.txt
  - s3://my-bucket/my_folder1/another_folder/my_file.txt
- The key is composed of prefix + object name
  - s3://my-bucket/my_folder1/another_folder/my_file.txt
- There's no concept of "directories" within buckets (although the UI will trick you to think otherwise)
- Just keys with very long names that contain slashes ("/")
Object

S3 Bucket
with Objects

Amazon S3 – Objects (cont.)

- Object values are the content of the body:
  - Max. Object Size is 5TB (5000GB)
  - If uploading more than 5GB, must use "multi-part upload"

- Metadata (list of text key / value pairs – system or user metadata)

- Tags (Unicode key / value pair – up to 10) – useful for security / lifecycle

- Version ID (if versioning is enabled)

Amazon S3 – Security

- User-Based
  - IAM Policies – which API calls should be allowed for a specific user from IAM

- Resource-Based
  - Bucket Policies – bucket wide rules from the S3 console - allows cross account
  - Object Access Control List (ACL) – finer grain (can be disabled)
  - Bucket Access Control List (ACL) – less common (can be disabled)

- **Note:** an IAM principal can access an S3 object if
  - The user IAM permissions ALLOW it <u>OR</u> the resource policy ALLOWS it
  - <u>AND</u> there's no explicit DENY

- **Encryption:** encrypt objects in Amazon S3 using encryption keys

S3 Bucket Policies

- JSON based policies
  - Resources: buckets and objects
  - Effect: Allow / Deny
  - Actions: Set of API to Allow or Deny
  - Principal: The account or user to apply the policy to

- Use S3 bucket for policy to:
  - Grant public access to the bucket
  - Force objects to be encrypted at upload
  - Grant access to another account (Cross Account)

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "PublicRead",
            "Effect": "Allow",
            "Principal": "*",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": [
                "arn:aws:s3:::examplebucket/*"
            ]
        }
    ]
}
```
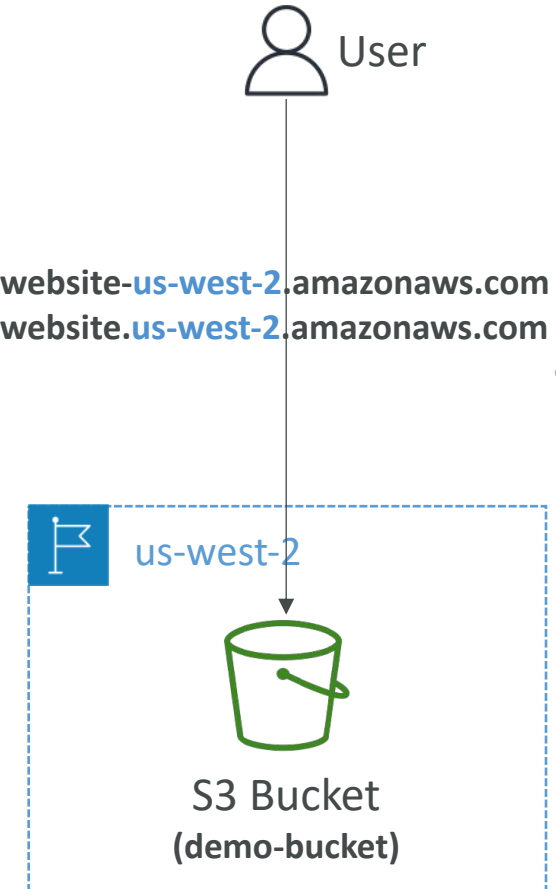

Example: Public Access - Use Bucket Policy

Bucket settings for Block Public Access

Block *all* public access
On
├── Block public access to buckets and objects granted through *new* access control lists (ACLs)
│   On
│
├── Block public access to buckets and objects granted through *any* access control lists (ACLs)
│   On
│
├── Block public access to buckets and objects granted through *new* public bucket or access point policies
│   On
│
└── Block public and cross-account access to buckets and objects through *any* public bucket or access point policies
    On

- These settings were created to prevent company data leaks
- If you know your bucket should never be public, leave these on
- Can be set at the account level

S3 Bucket Policies

- Use S3 bucket for policy to:
  - Grant public access to the bucket
  - Force objects to be encrypted at upload
  - **Grant access to another account (Cross Account)**

- Optional Conditions on:
  - Public IP or Elastic IP (<u>not</u> on Private IP)
  - Source VPC or Source VPC Endpoint – only works with VPC Endpoints
  - CloudFront Origin Identity
  - MFA

- Examples here: https://docs.aws.amazon.com/AmazonS3/latest/dev/example-bucket-policies.html

Bucket Policies – Advanced Examples

- Restrict access to only principals from AWS accounts inside an AWS Organization using aws:PrincipalOrgID condition key

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": "*",
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::mybucket/*",
            "Condition": {
                "StringEquals": {
                    "aws:PrincipalOrgID": ["o-exampleorgid"]
                }
            }
        }
    ]
}
```

- Prevent uploads of unencrypted objects to an S3 bucket using s3:x-amz-server-side-encryption condition key

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:PutObject",
            "Resource": "arn:aws:s3:::mybucket/*",
            "Condition": {
                "Null": {
                    "s3:x-amz-server-side-encryption": true
                }
            }
        }
    ]
}
```

Bucket Policies – Advanced Examples

- Restrict access to specific IP addresses using **NotIpAddress** condition key

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:*",
            "Resource": [
                "arn:aws:s3:::mybucket",
                "arn:aws:s3:::mybucket/*"
            ],
            "Condition": {
                "NotIpAddress": {
                    "aws:SourceIp": "54.240.143.0/24"
                }
            }
        }
    ]
}
```

Bucket Policies – Advanced Examples

- Grant user access to list and download all objects in an S3 bucket

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": "*",
            "Action": "s3:ListBucket",
            "Resource": "arn:aws:s3:::mybucket"
        },
        {
            "Effect": "Allow",
            "Principal": "*",
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::mybucket/*"
        }
    ]
}
```

- Restrict access to users authenticated using MFA using **MultiFactorAuthPresent** condition key

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": "*",
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::mybucket/*",
            "Condition": {
                "Bool": {
                    "aws:MultiFactorAuthPresent": "true"
                }
            }
        }
    ]
}
```

Amazon S3 – Static Website Hosting

- S3 can host static websites and have them accessible on the Internet

User

http://**demo-bucket**.s3-website-**us-west-2**.amazonaws.com
http://**demo-bucket**.s3-website.**us-west-2**.amazonaws.com

- The website URL will be (depending on the region)
  - http://*bucket-name*.s3-website-*aws-region*.amazonaws.com

  OR

  - http://*bucket-name*.s3-website.*aws-region*.amazonaws.com

us-west-2

S3 Bucket
(demo-bucket)

- If you get a **403 Forbidden** error, make sure the bucket policy allows public reads!

© Stephane Maarek

Amazon S3 - Versioning

- You can version your files in Amazon S3

- It is enabled at the **bucket level**

- Same key overwrite will change the "version": 1, 2, 3….

- It is best practice to version your buckets
  - Protect against unintended deletes (ability to restore a version)
  - Easy roll back to previous version

- Notes:
  - Any file that is not versioned prior to enabling versioning will have version "null"
  - Suspending versioning does not delete the previous versions

User

upload

S3 Bucket
(my-bucket)

Version 1   Version 2

Version 3

s3://my-bucket/my-file.docx
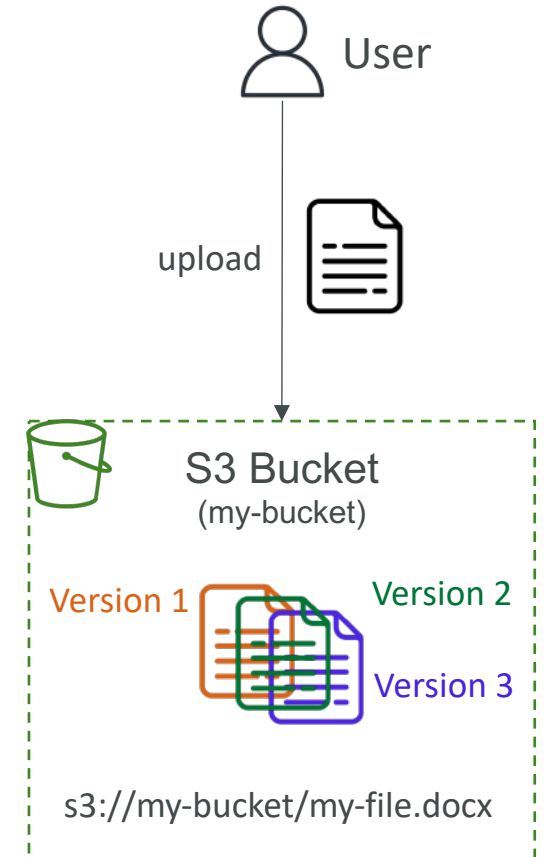

Amazon S3 – Replication (CRR & SRR)

- **Must enable Versioning** in source and destination buckets
- Cross-Region Replication (CRR)
- Same-Region Replication (SRR)
- Buckets can be in different AWS accounts
- Copying is asynchronous
- Must give proper IAM permissions to S3

- Use cases:
  - CRR – compliance, lower latency access, replication across accounts
  - SRR – log aggregation, live replication between production and test accounts

S3 Bucket
(eu-west-1)

asynchronous
replication

S3 Bucket
(us-east-2)
Amazon S3 – Replication (Notes)

- After you enable Replication, only new objects are replicated

- Optionally, you can replicate existing objects using **S3 Batch Replication**
  - Replicates existing objects and objects that failed replication

- For DELETE operations
  - **Can replicate delete markers** from source to target (optional setting)
  - Deletions with a version ID are not replicated (to avoid malicious deletes)

- **There is no "chaining" of replication**
  - If bucket 1 has replication into bucket 2, which has replication into bucket 3
  - Then objects created in bucket 1 are not replicated to bucket 3

S3 Storage Classes

- Amazon S3 Standard - General Purpose
- Amazon S3 Standard-Infrequent Access (IA)
- Amazon S3 One Zone-Infrequent Access
- Amazon S3 Glacier Instant Retrieval
- Amazon S3 Glacier Flexible Retrieval
- Amazon S3 Glacier Deep Archive
- Amazon S3 Intelligent Tiering

- Can move between classes manually or using S3 Lifecycle configurations

S3 Durability and Availability

- Durability:
  - High durability (99.999999999%, 11 9's) of objects across multiple AZ
  - If you store 10,000,000 objects with Amazon S3, you can on average expect to incur a loss of a single object once every 10,000 years
  - Same for all storage classes

- Availability:
  - Measures how readily available a service is
  - Varies depending on storage class
  - Example: S3 standard has 99.99% availability = not available 53 minutes a year

S3 Standard – General Purpose

- 99.99% Availability
- Used for frequently accessed data
- Low latency and high throughput
- Sustain 2 concurrent facility failures

- Use Cases: Big Data analytics, mobile & gaming applications, content distribution…

S3 Storage Classes – Infrequent Access

- For data that is less frequently accessed, but requires rapid access when needed
- Lower cost than S3 Standard

- Amazon S3 Standard-Infrequent Access (S3 Standard-IA)
  - 99.9% Availability
  - Use cases: Disaster Recovery, backups

- Amazon S3 One Zone-Infrequent Access (S3 One Zone-IA)
  - High durability (99.999999999%) in a single AZ; data lost when AZ is destroyed
  - 99.5% Availability
  - Use Cases: Storing secondary backup copies of on-premises data, or data you can recreate

Amazon S3 Glacier Storage Classes

- Low-cost object storage meant for archiving / backup
- Pricing: price for storage + object retrieval cost

- **Amazon S3 Glacier Instant Retrieval**
  - Millisecond retrieval, great for data accessed once a quarter
  - Minimum storage duration of 90 days
- **Amazon S3 Glacier Flexible Retrieval** (formerly Amazon S3 Glacier):
  - Expedited (1 to 5 minutes), Standard (3 to 5 hours), Bulk (5 to 12 hours) – free
  - Minimum storage duration of 90 days
- **Amazon S3 Glacier Deep Archive** – for long term storage:
  - Standard (12 hours), Bulk (48 hours)
  - Minimum storage duration of 180 days

S3 Intelligent-Tiering

- Small monthly monitoring and auto-tiering fee
- Moves objects automatically between Access Tiers based on usage
- There are no retrieval charges in S3 Intelligent-Tiering

- *Frequent Access tier (automatic):* default tier
- *Infrequent Access tier (automatic)*: objects not accessed for 30 days
- *Archive Instant Access tier (automatic):* objects not accessed for 90 days
- *Archive Access tier (optional):* configurable from 90 days to 700+ days
- *Deep Archive Access tier (optional):* config. from 180 days to 700+ days

S3 Storage Classes Comparison

	Standard	Intelligent-Tiering	Standard-IA	One Zone-IA	Glacier Instant Retrieval	Glacier Flexible Retrieval	Glacier Deep Archive
Durability	99.999999999% == (11 9's)						
Availability	99.99%	99.9%	99.9%	99.5%	99.9%	99.99%	99.99%

Retrieval Fee	None	None	Per GB retrieved	Per GB retrieved	Per GB retrieved	Per GB retrieved	Per GB retrieved

https://aws.amazon.com/s3/storage-classes/

S3 Storage Classes – Price Comparison Example: us-east-1

	Standard	Intelligent-Tiering	Standard-IA	One Zone-IA	Glacier Instant Retrieval	Glacier Flexible Retrieval	Glacier Deep Archive
Storage Cost (per GB per month)	$0.023	$0.0025 - $0.023	$0.0125	$0.01	$0.004	$0.0036	$0.00099
Retrieval Cost (per 1000 request)	**GET:** $0.0004 **POST:** $0.005	**GET:** $0.0004 **POST:** $0.005	**GET:** $0.001 **POST:** $0.01	**GET:** $0.001 **POST:** $0.01	**GET:** $0.01 **POST:** $0.02	**GET:** $0.0004 **POST:** $0.03 **Expedited:** $10 **Standard:** $0.05 **Bulk:** free	**GET:** $0.0004 **POST:** $0.05 **Standard:** $0.10 **Bulk:** $0.025
Retrieval Time	Instantaneous					**Expedited** (1 – 5 mins) **Standard** (3 – 5 hours) Bulk (5 – 12 hours)	**Standard** (12 hours) **Bulk** (48 hours)
Monitoring Cost (pet 1000 objects)		$0.0025					

https://aws.amazon.com/s3/pricing/

Amazon S3 – Advanced

Amazon S3 – Moving between Storage Classes

- You can transition objects between storage classes

- For infrequently accessed object, move them to Standard IA

- For archive objects that you don't need fast access to, move them to Glacier or Glacier Deep Archive

- Moving objects can be automated using a Lifecycle Rules

Standard

Standard IA

Intelligent Tiering

One-Zone IA

Glacier Instant Retrieval

Glacier Flexible Retrieval

Glacier Deep Archive
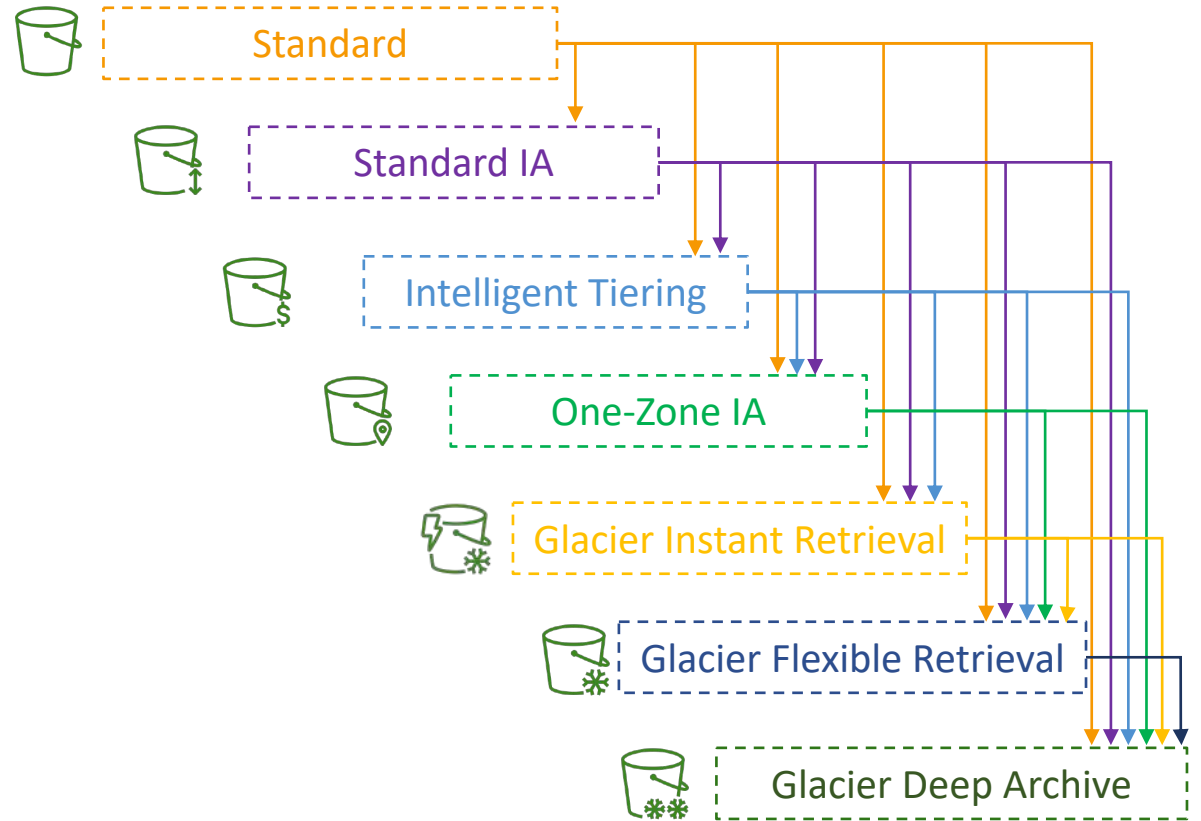

Amazon S3 – Lifecycle Rules

- **Transition Actions –** configure objects to transition to another storage class
  - Move objects to Standard IA class 60 days after creation
  - Move to Glacier for archiving after 6 months

- **Expiration actions –** configure objects to expire (delete) after some time
  - Access log files can be set to delete after a 365 days
  - **Can be used to delete old versions of files (if versioning is enabled)**
  - Can be used to delete incomplete Multi-Part uploads

- Rules can be created for a certain prefix (example: *s3://mybucket/mp3/**)
- Rules can be created for certain objects Tags (example: *Department: Finance*)

Amazon S3 – Lifecycle Rules (Scenario 1)

- Your application on EC2 creates images thumbnails after profile photos are uploaded to Amazon S3. These thumbnails can be easily recreated, and only need to be kept for 60 days. The source images should be able to be immediately retrieved for these 60 days, and afterwards, the user can wait up to 6 hours. How would you design this?

- S3 source images can be on **Standard**, with a lifecycle configuration to transition them to **Glacier** after 60 days

- S3 thumbnails can be on **One-Zone IA**, with a lifecycle configuration to expire them (delete them) after 60 days

Amazon S3 – Lifecycle Rules (Scenario 2)

- A rule in your company states that you should be able to recover your deleted S3 objects immediately for 30 days, although this may happen rarely. After this time, and for up to 365 days, deleted objects should be recoverable within 48 hours.

- **Enable S3 Versioning** in order to have object versions, so that "deleted objects" are in fact hidden by a "delete marker" and can be recovered

- Transition the "noncurrent versions" of the object to **Standard IA**

- Transition afterwards the "noncurrent versions" to **Glacier Deep Archive**

Amazon S3 Analytics – Storage Class Analysis

- Help you decide when to transition objects to the right storage class

- Recommendations for **Standard** and **Standard IA**
  - Does NOT work for One-Zone IA or Glacier

- Report is updated daily

- 24 to 48 hours to start seeing data analysis

- Good first step to put together Lifecycle Rules (or improve them)!
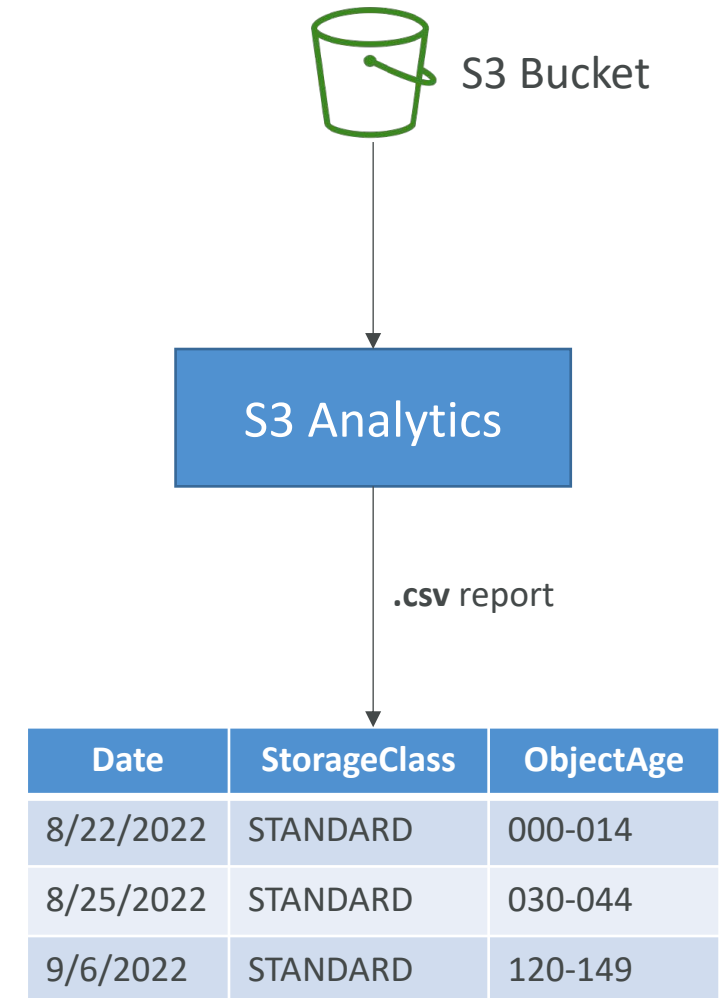

S3 Bucket

S3 Analytics

.csv report

Date	StorageClass	ObjectAge
8/22/2022	STANDARD	000-014
8/25/2022	STANDARD	030-044
9/6/2022	STANDARD	120-149

S3 Event Notifications

- S3:ObjectCreated, S3:ObjectRemoved, S3:ObjectRestore, S3:Replication…

- Object name filtering possible (*.jpg)

- Use case: generate thumbnails of images uploaded to S3

- **Can create as many "S3 events" as desired**

- S3 event notifications typically deliver events in seconds but can sometimes take a minute or longer

events → Amazon S3 → SNS
Amazon S3 → SQS
Amazon S3 → Lambda Function
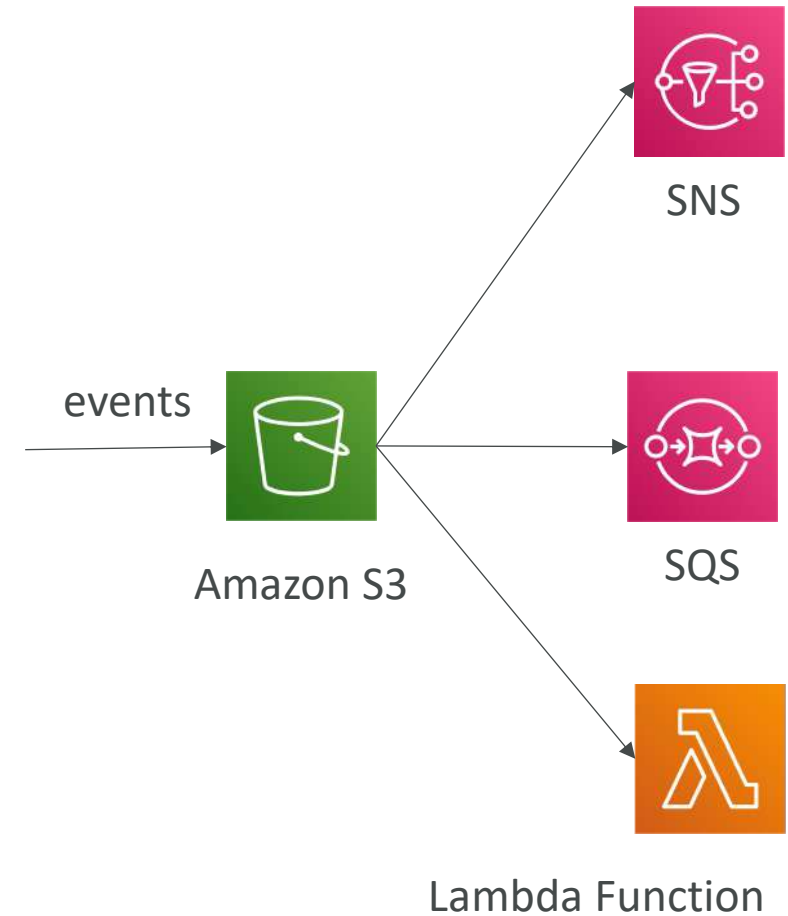

S3 Event Notifications – IAM Permissions

events → Amazon S3

SNS

```
{
  "Version": "2012-10-17",

        "AWS:SourceArn": "arn:aws:s3:::MyBucket"
      }
    }
  }
}
```
Lambda Resource Policy

S3 Event Notifications with Amazon EventBridge

events → **Amazon S3 bucket** → All events → **Amazon EventBridge** → rules → Over 18 AWS services as destinations

- **Advanced filtering** options with JSON rules (metadata, object size, name...)

- **Multiple Destinations** – ex Step Functions, Kinesis Streams / Firehose…

- **EventBridge Capabilities** – Archive, Replay Events, Reliable delivery

S3 – Baseline Performance

- Amazon S3 automatically scales to high request rates, latency 100-200 ms

- Your application can achieve at least **3,500 PUT/COPY/POST/DELETE or 5,500 GET/HEAD requests per second per prefix in a bucket.**

- There are no limits to the number of prefixes in a bucket.

- Example (object path => prefix):
    - bucket/folder1/sub1/file => /folder1/sub1/
    - bucket/folder1/sub2/file => /folder1/sub2/
    - bucket/1/file   => /1/
    - bucket/2/file   => /2/

- If you spread reads across all four prefixes evenly, you can achieve 22,000 requests per second for GET and HEAD

S3 Performance

- Multi-Part upload:
  - recommended for files > 100MB, must use for files > 5GB
  - Can help parallelize uploads (speed up transfers)

Divide In parts → Parallel uploads → Amazon S3

BIG file
- S3 Transfer Acceleration
  - Increase transfer speed by transferring file to an AWS edge location which will forward the data to the S3 bucket in the target region
  - Compatible with multi-part upload

Fast (public www) → Edge Location → Fast (private AWS)

File in USA   **Edge Location** USA   **S3 Bucket** Australia
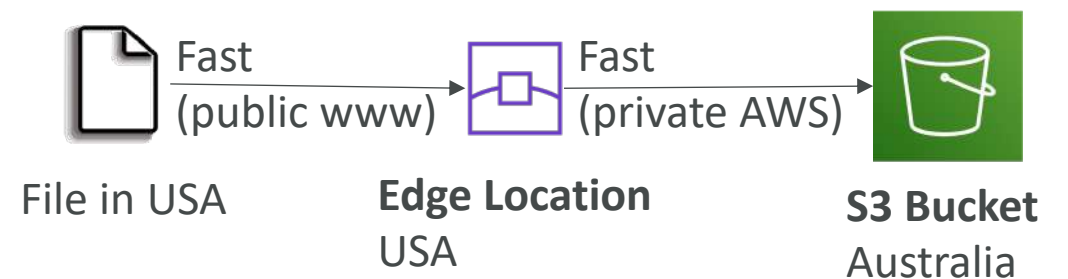

S3 Performance – S3 Byte-Range Fetches

- Parallelize GETs by requesting specific byte ranges
- Better resilience in case of failures

Can be used to speed up downloads
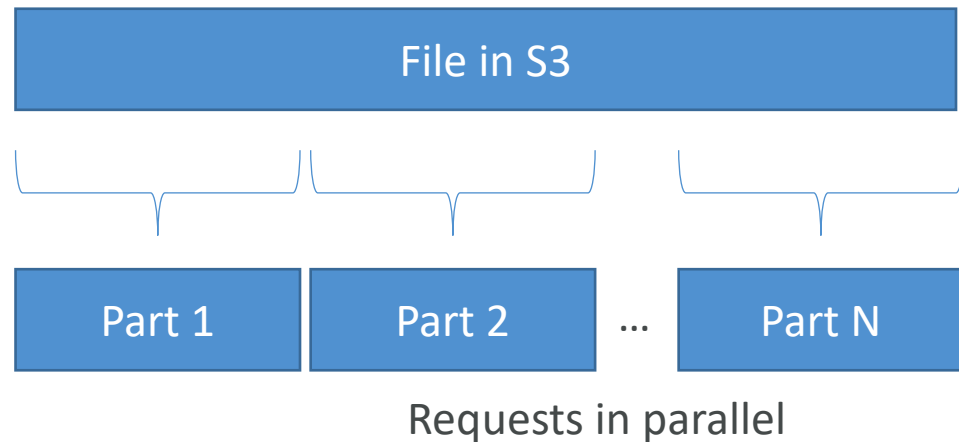

Can be used to retrieve only partial data (for example the head of a file)

File in S3

Part 1	Part 2	...	Part N

Requests in parallel

File in S3

Byte-range request for header (first XX bytes)

header
S3 Batch Operations

- Perform bulk operations on existing S3 objects with a single request, example:
  - Modify object metadata & properties
  - Copy objects between S3 buckets
  - **Encrypt un-encrypted objects**
  - Modify ACLs, tags
  - Restore objects from S3 Glacier
  - Invoke Lambda function to perform custom action on each object
- A job consists of a list of objects, the action to perform, and optional parameters
- S3 Batch Operations manages retries, tracks progress, sends completion notifications, generate reports …
- You can use S3 Inventory to get object list and use S3 Select to filter your objects

S3 Inventory

Objects List Report

S3 Select

filter

filtered list

operation
+
parameters

User

S3 Batch Operations

Processed Objects

○ ○ ○ ○ …
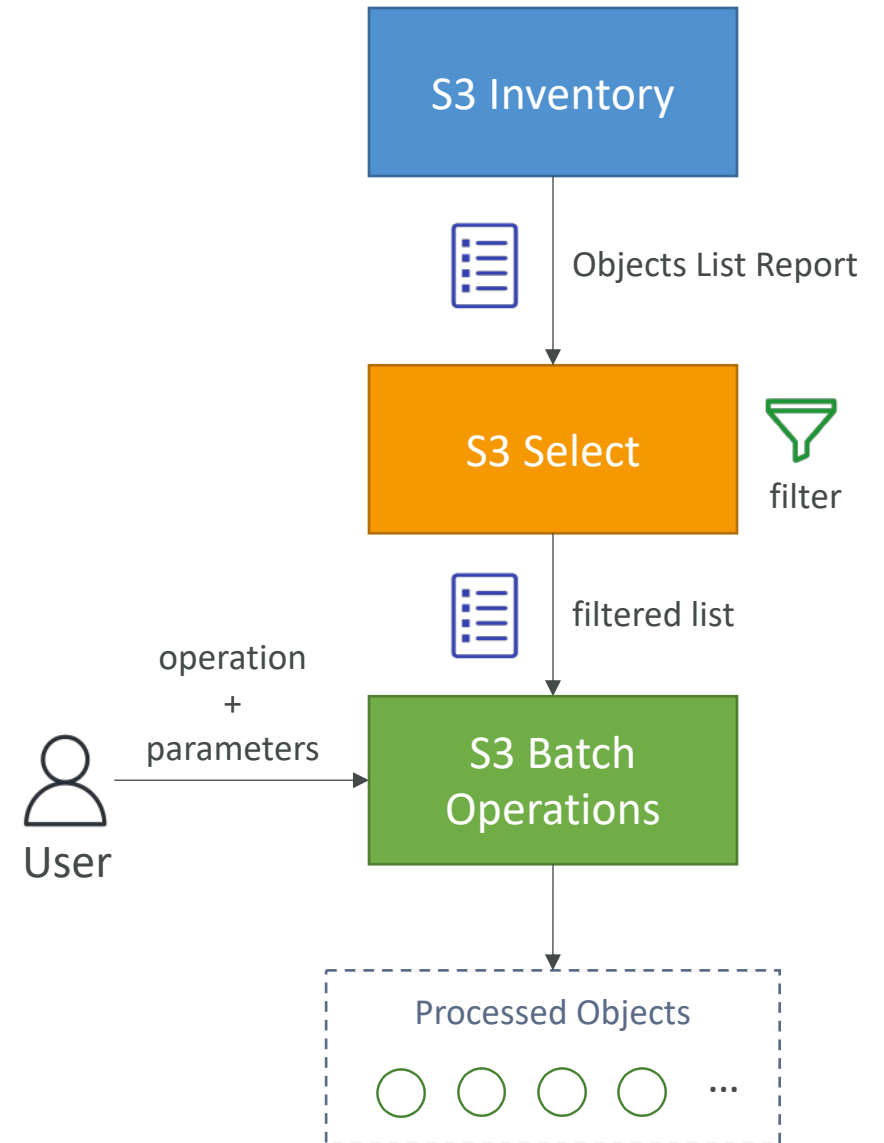

S3 Inventory

- List objects and their corresponding metadata (alternative to S3 **List** API operation)

- Usage examples:
  - Audit and report on the replication and encryption status of your objects
  - Get the number of objects in an S3 bucket
  - Identify the total storage of previous object versions

- Generate daily or weekly reports

- Output files: CSV, ORC, or Apache Parquet

- You can query all the data using Amazon Athena, Redshift, Presto, Hive, Spark…

- You can filter generated report using S3 Select

- Use cases: Business, Compliance, Regulatory needs, …

Amazon S3 Glacier

- Low-cost object storage meant for archiving / backup
- Data is retained for the longer term (10s of years)
- Alternative to on-premises magnetic tape storage
- Average annual durability is 99.999999999%
- Cost per storage per month ($0.004 / GB – Standard | $0.00099 / GB Deep Archive)

- Each item in Glacier is called "**Archive**" (up to 40TB)
- Archives are stored in "**Vaults**"
- By default, data encrypted at rest using AES-256 – keys managed by AWS

- Exam tip: archival from S3 after XXX days => use Glacier

Amazon S3 Glacier Operations

- Vault Operations:
  - **Create & Delete** – delete only when there's no archives in it
  - **Retrieving Metadata** – creation date, number of archives, total size of all archives, …
  - **Download Inventory** – list of archives in the vault (archive ID, creation date, size, …)
- Glacier Operations:
  - **Upload** - single operation or by parts (MultiPart upload) for larger archives
  - **Download** - first initiate a retrieval job for the archive, Glacier then prepares it for download. User then has a limited time to download the data from staging server. (optionally, specify a range or portion of bytes to retrieve)
  - **Delete** - use Glacier Rest API or AWS SDKs by specifying archive ID
- Restore links have an expiry date
- Retrieval Options:
  - **Expedited (1 to 5 minutes retrieval)** – $0.03 per GB and $10 per 1000 requests
  - **Standard (3 to 5 hours)** - $0.01 per GB and 0.03 per 1000 requests
  - **Bulk (5 to 12 hours)** - $0.0025 per GB and $0.025 per 1000 requests

Amazon S3 Glacier - Vault Policies & Vault Lock

- Each Vault has:
  - ONE vault access policy
  - ONE vault lock policy
- Vault Policies are written in JSON
- Vault Access Policy is like a bucket policy (restrict user / account permissions)
- Vault Lock Policy is a policy you lock, for regulatory and compliance requirements.
  - The policy is immutable, **it can never be changed (that's why it's call LOCK)**
  - Example 1: forbid deleting an archive if less than 1 year old
  - Example 2: implement WORM policy (write once read many)

Users

Permissions

Vault Access Policy

Vault

Vault Lock Policy

Archives
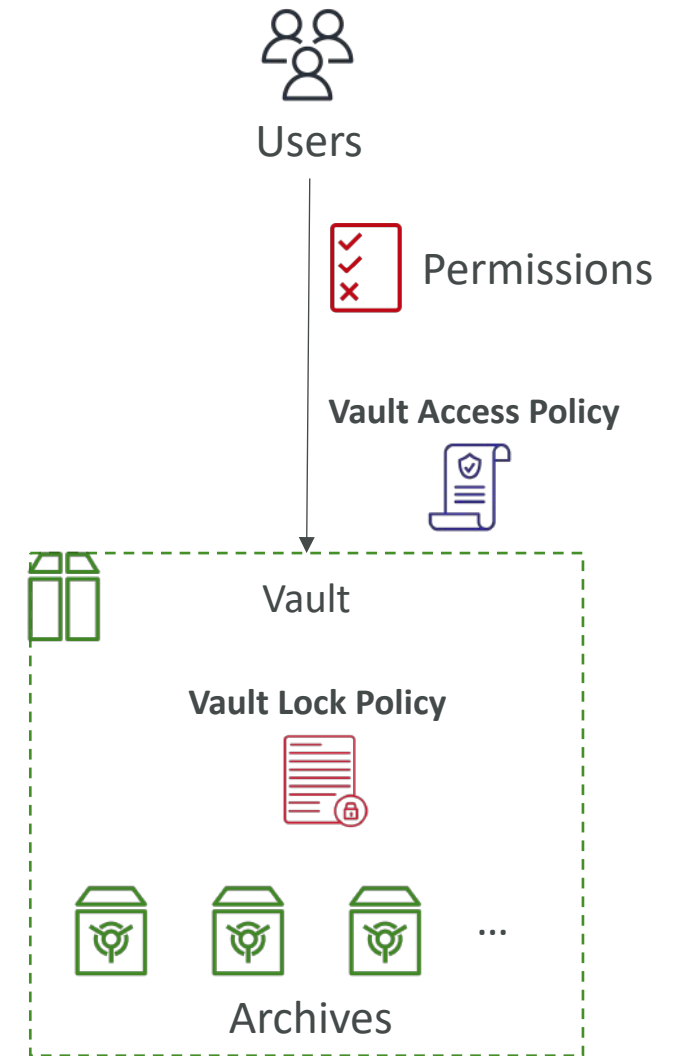

Glacier – Notifications for Restore Operations

- Vault Notification Configuration
  - Configure a vault so that when a job completes, a message is sent to SNS
  - Optionally, specify an SNS topic when you initiate a job
- S3 Event Notifications
  - S3 supports the restoration of objects archived to S3 Glacier storage classes
  - s3:ObjectRestore:Post => notify when object restoration initiated
  - s3:ObjectRestore:Completed => notify when object restoration completed

© Stephane Maarek
S3 Multi Part Upload – Deep Dive

- Upload large objects in parts (any order)
- Recommended for files > 100MB, must use for files > 5GB
- Can help parallelize uploads (speed up transfers)
- Max. parts: 10,000
- **Failures:** restart uploading ONLY failed parts (improves performance)
- Use **Lifecycle Policy to automate old parts deletion** of unfinished upload after x days (e.g., network outage)
- Upload using AWS CLI or AWS SDK

BIG file

parts (max. 10,000)

parallel uploads

Amazon S3

Concatenating parts (COMPLETE request)
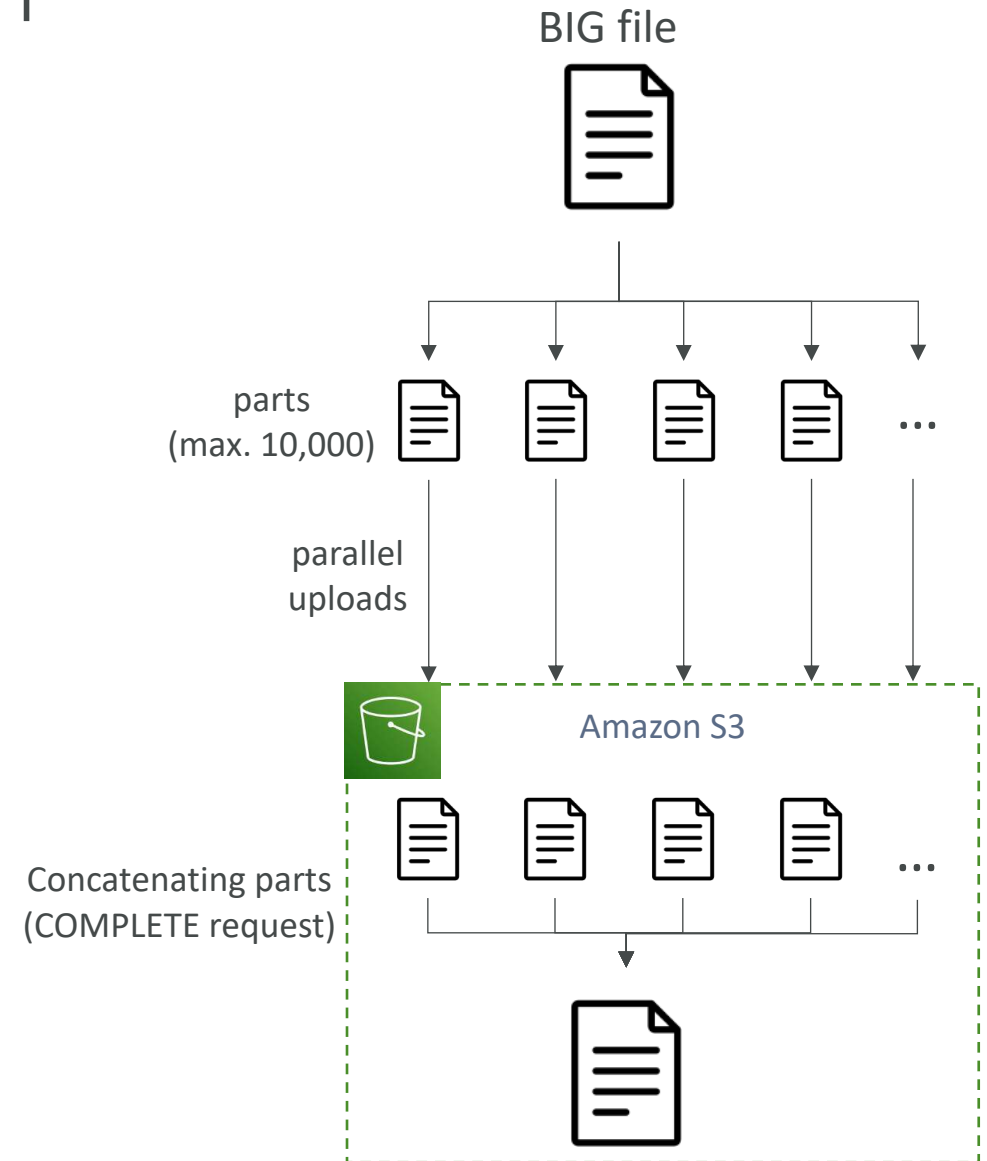

Amazon Athena

- **Serverless** query service to analyze data stored in Amazon S3

- Uses standard SQL language to query the files (built on Presto)

- Supports CSV, JSON, ORC, Avro, and Parquet

- Pricing: $5.00 per TB of data scanned

- Commonly used with Amazon Quicksight for reporting/dashboards

- **Use cases:** Business intelligence / analytics / reporting, analyze & query VPC Flow Logs, ELB Logs, **CloudTrail trails**, etc...

- <u>Exam Tip:</u> analyze data in S3 using serverless SQL, use Athena

load data

S3 Bucket

Query & Analyze

Amazon Athena

Reporting & Dashboards

Amazon QuickSight
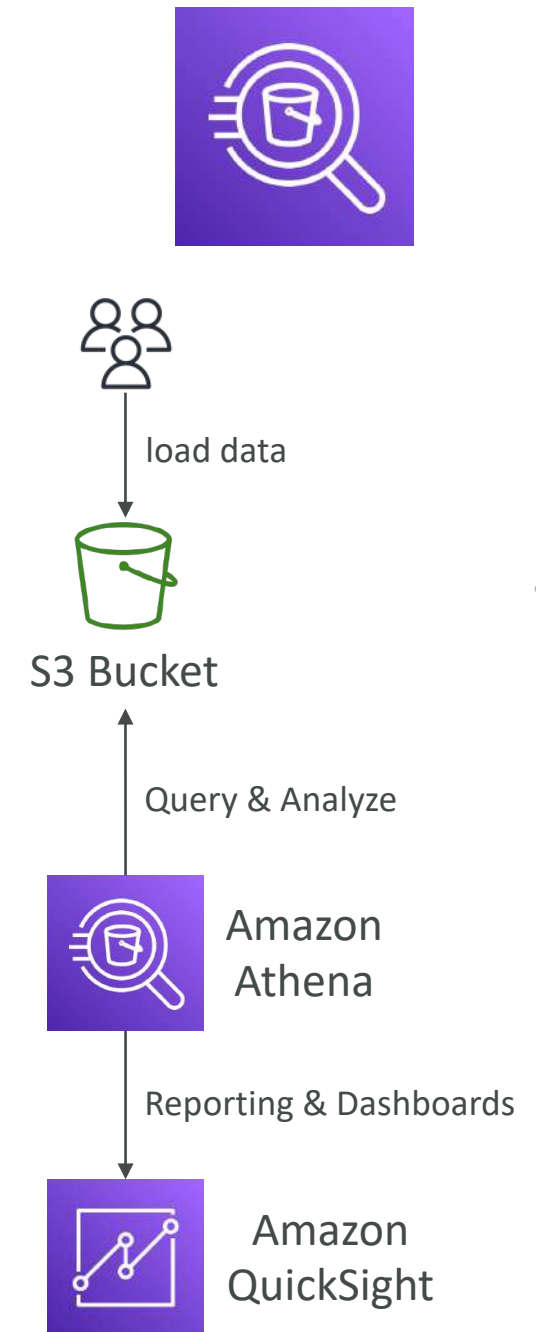

Amazon Athena – Performance Improvement

- Use **columnar data** for cost-savings (less scan)
  - Apache Parquet or ORC is recommended
  - Huge performance improvement
  - Use Glue to convert your data to Parquet or ORC
- **Compress data** for smaller retrievals (bzip2, gzip, lz4, snappy, zlip, zstd…)
- **Partition** datasets in S3 for easy querying on virtual columns
  - s3://yourBucket/pathToTable
                /<PARTITION_COLUMN_NAME>=<VALUE>
                /<PARTITION_COLUMN_NAME>=<VALUE>
                /<PARTITION_COLUMN_NAME>=<VALUE>
                /etc…
  - Example: s3://athena-examples/flight/parquet/year=1991/month=1/day=1/
- **Use larger files** (> 128 MB) to minimize overhead

Amazon Athena – Federated Query

- Allows you to run SQL queries across data stored in relational, non-relational, object, and custom data sources (AWS or on-premises)

- Uses Data Source Connectors that run on AWS Lambda to run Federated Queries (e.g., CloudWatch Logs, DynamoDB, RDS, …)

- Store the results back in Amazon S3

S3 Bucket

MySQL
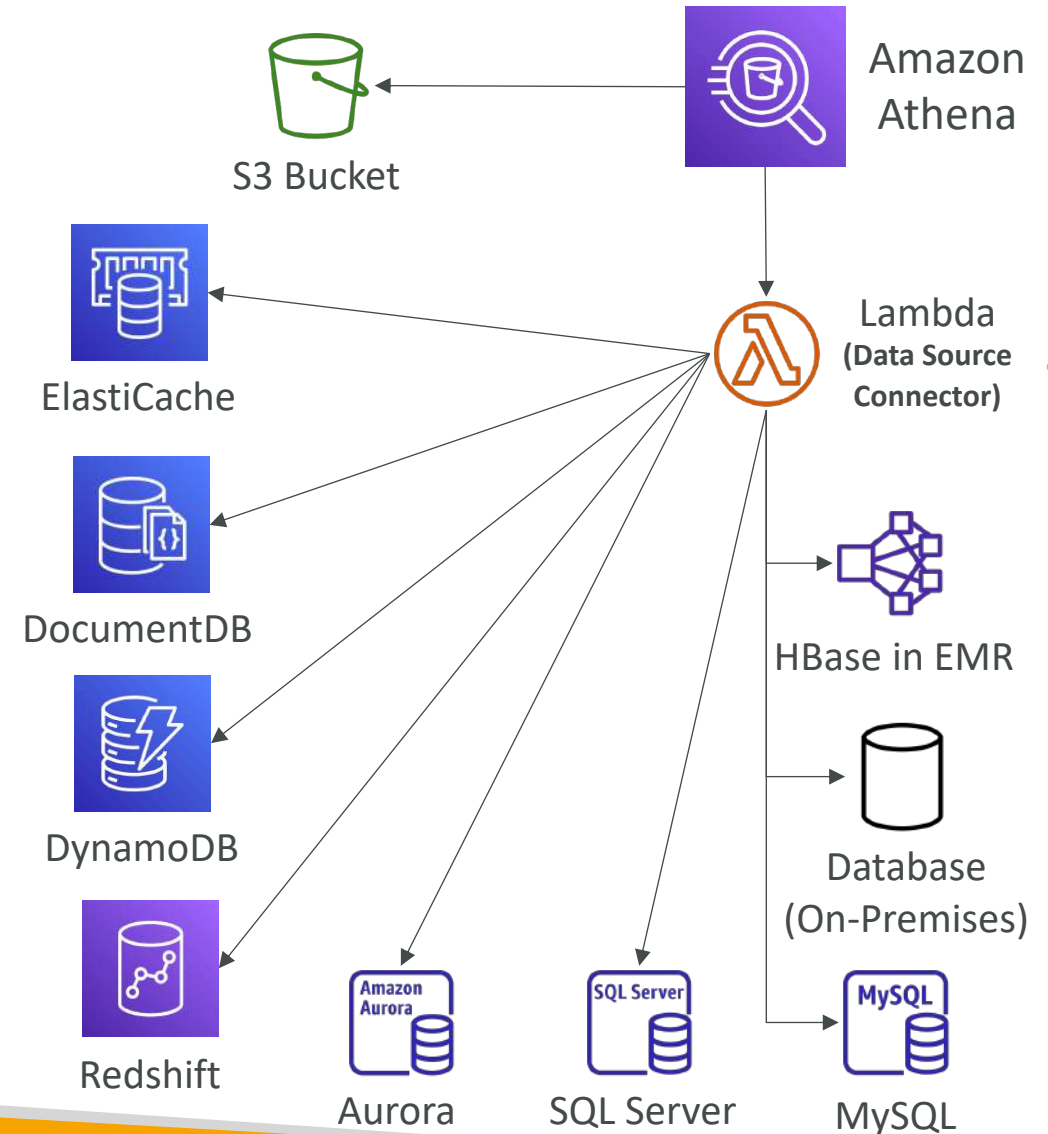

Amazon S3 – Security

Amazon S3 – Object Encryption

- You can encrypt objects in S3 buckets using one of 4 methods

- Server-Side Encryption (SSE)
  - Server-Side Encryption with Amazon S3-Managed Keys (SSE-S3) – <u>Enabled by Default</u>
    - Encrypts S3 objects using keys handled, managed, and owned by AWS
  - Server-Side Encryption with KMS Keys stored in AWS KMS (SSE-KMS)
    - Leverage AWS Key Management Service (AWS KMS) to manage encryption keys
  - Server-Side Encryption with Customer-Provided Keys (SSE-C)
    - When you want to manage your own encryption keys

- Client-Side Encryption

- It's important to understand which ones are for which situation for the exam

Amazon S3 Encryption – SSE-S3

- Encryption using keys handled, managed, and owned by AWS
- Object is encrypted server-side
- Encryption type is **AES-256**
- Must set header **"x-amz-server-side-encryption": "AES256"**
- **Enabled by default for new buckets & new objects**
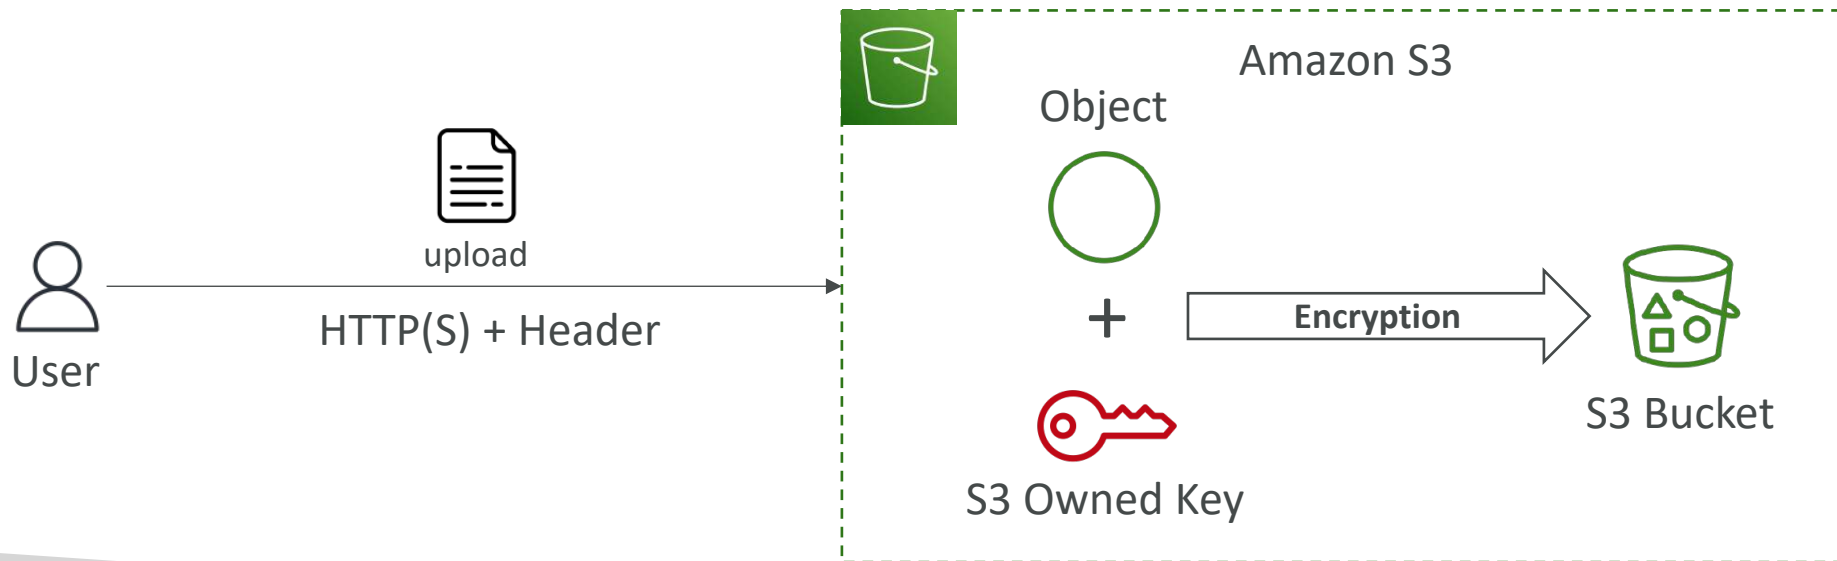

Amazon S3 Encryption – SSE-KMS

- Encryption using keys handled and managed by AWS KMS (Key Management Service)
- KMS advantages: user control + audit key usage using CloudTrail
- Object is encrypted server side
- Must set header **"x-amz-server-side-encryption": "aws:kms"**
SSE-KMS Limitation

- If you use SSE-KMS, you may be impacted by the KMS limits

- When you upload, it calls the **GenerateDataKey** KMS API

- When you download, it calls the **Decrypt** KMS API

- Count towards the KMS quota per second (5500, 10000, 30000 req/s based on region)

- You can request a quota increase using the Service Quotas Console

S3 Bucket   **KMS Key**

API call

S3 Bucket
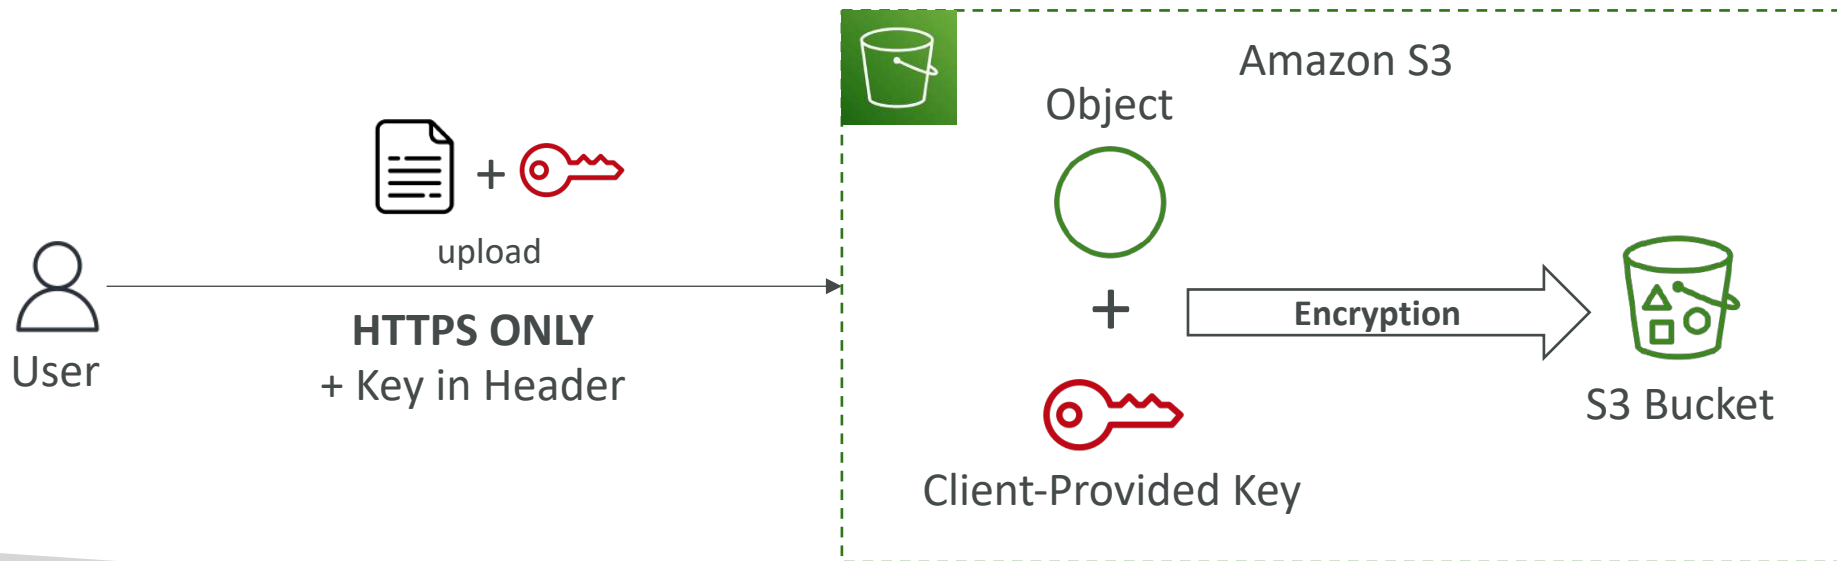

Amazon S3 Encryption – Client-Side Encryption

- Use client libraries such as **Amazon S3 Client-Side Encryption Library**
- Clients must encrypt data themselves before sending to Amazon S3
- Clients must decrypt data themselves when retrieving from Amazon S3
- Customer fully manages the keys and encryption cycle
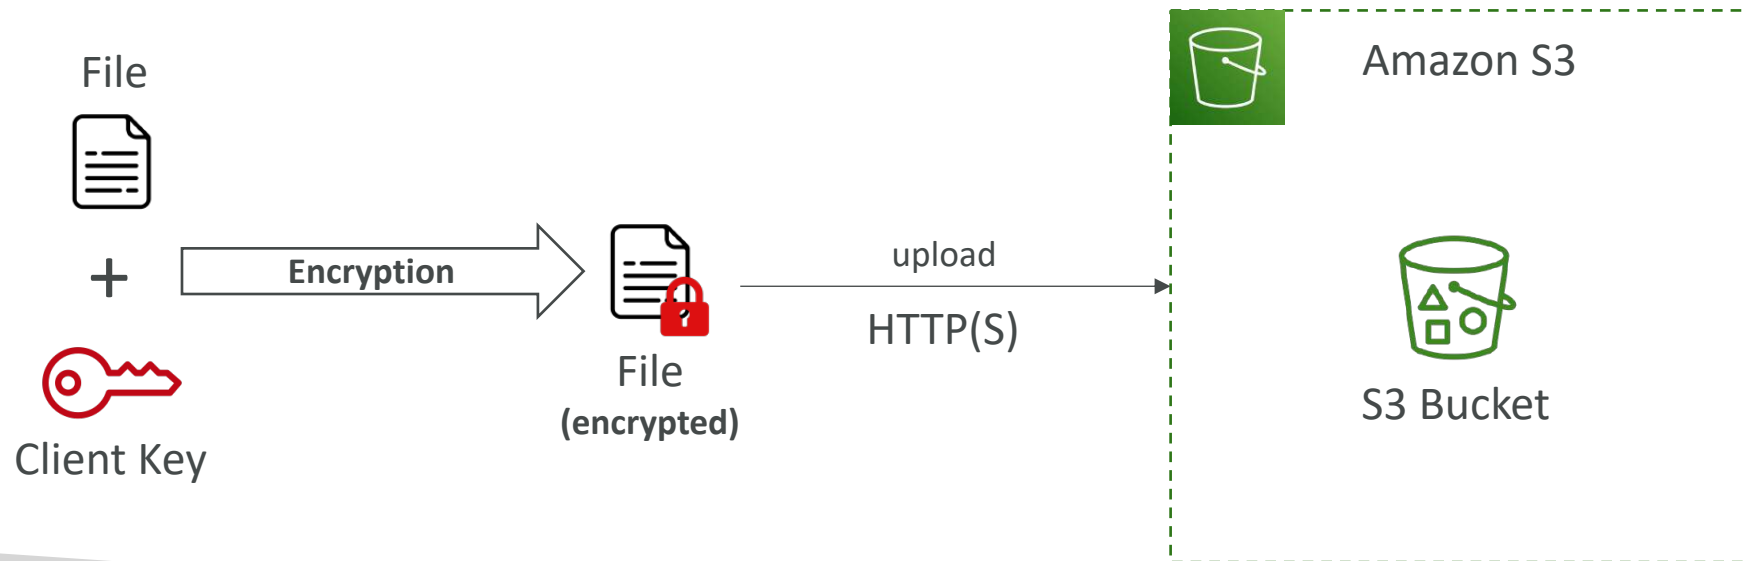

Amazon S3 – Encryption in transit (SSL/TLS)

- Encryption in flight is also called SSL/TLS

- Amazon S3 exposes two endpoints:
  - **HTTP Endpoint** – non encrypted
  - **HTTPS Endpoint** – encryption in flight

- **HTTPS is recommended**

- **HTTPS is mandatory for SSE-C**

- Most clients would use the HTTPS endpoint by default

Amazon S3 – Force Encryption in Transit aws:SecureTransport
User → *http* → ✗

User → *https* → ✓

Account B

S3 Bucket
(my-bucket)

Bucket Policy

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Principal": "*",
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:::my-bucket/*",
            "Condition": {
                "Bool": {
                    "aws:SecureTransport": "false"
                }
            }
        }
    ]
}
```

Amazon S3 – Default Encryption vs. Bucket Policies

- SSE-S3 encryption is automatically applied to new objects stored in S3 bucket
- Optionally, you can "force encryption" using a bucket policy and refuse any API call to PUT an S3 object without encryption headers (SSE-KMS or SSE-C)

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "s3:PutObject",
            "Principal": "*",
            "Resource": "arn:aws:s3:::my-bucket/*",
            "Condition": {
                "StringNotEquals": {
                    "s3:x-amz-server-side-encryption": "aws:kms"
                }
            }
        }
    ]
}
```

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "s3:PutObject",
            "Principal": "*",
            "Resource": "arn:aws:s3:::my-bucket/*",
            "Condition": {
                "Null": {
                    "s3:x-amz-server-side-encryption-customer-algorithm": "true"
                }
            }
        }
    ]
}
```

- <u>Note</u>: Bucket Policies are evaluated before "Default Encryption"

What is CORS?

- Cross-Origin Resource Sharing (CORS)
- Origin = scheme (protocol) + host (domain) + port
  - example: https://www.example.com (implied port is 443 for HTTPS, 80 for HTTP)
- **Web Browser** based mechanism to allow requests to other origins while visiting the main origin
- Same origin: http://example.com/app1 & http://example.com/app2
- Different origins: http://www.example.com & http://other.example.com
- The requests won't be fulfilled unless the other origin allows for the requests, using **CORS Headers** (example: **Access-Control-Allow-Origin**)

What is CORS?

OPTIONS /
Host: www.other.com
Origin: https://www.example.com

Preflight Request

Access-Control-Allow-Origin: https://www.example.com
Access-Control-Allow-Methods: GET, PUT, DELETE

HTTPS Request

Preflight Response

Web Browser

**Web Server
(Origin)**

https://www.example.com

**Web Server
(Cross-Origin)**

https://www.other.com

GET /
Host: www.other.com
Origin: https://www.example.com

CORS Headers received already by the Origin
The Web Browser can make requests

Amazon S3 – CORS

- If a client makes a cross-origin request on our S3 bucket, we need to enable the correct CORS headers
- It's a popular exam question
- You can allow for a specific origin or for * (all origins)

GET /index.html

Amazon S3 – MFA Delete

- MFA (Multi-Factor Authentication) – force users to generate a code on a device (usually a mobile phone or hardware) before doing important operations on S3
- MFA will be required to:
  - Permanently delete an object version
  - Suspend Versioning on the bucket
- MFA won't be required to:
  - Enable Versioning
  - List deleted versions
- To use MFA Delete, **Versioning must be enabled** on the bucket
- **Only the bucket owner (root account) can enable/disable MFA Delete**

Google Authenticator

MFA Hardware Device

S3 Access Logs

- For audit purpose, you may want to log all access to S3 buckets

- Any request made to S3, from any account, authorized or denied, will be logged into another S3 bucket

- That data can be analyzed using data analysis tools…

- The target logging bucket must be in the same AWS region

- The log format is at:
https://docs.aws.amazon.com/AmazonS3/latest/dev/LogFormat.html

requests

My-bucket

Log all
requests
Logging Bucket

S3 Access Logs: Warning

- Do not set your logging bucket to be the monitored bucket
- It will create a logging loop, and **your bucket will grow exponentially**

PutObject

Logging loop

Amazon S3 – Pre-Signed URLs

- Generate pre-signed URLs using the **S3 Console, AWS CLI or SDK**
- URL Expiration
  - **S3 Console** – 1 min up to 720 mins (12 hours)
  - **AWS CLI** – configure expiration with *--expires-in* parameter in seconds (default 3600 secs, max. 604800 secs ~ 168 hours)
- Users given a pre-signed URL inherit the permissions of the user that generated the URL for GET / PUT

- Examples:
  - Allow only logged-in users to download a premium video from your S3 bucket
  - Allow an ever-changing list of users to download files by generating URLs dynamically
  - Allow temporarily a user to upload a file to a precise location in your S3 bucket

Owner

generate pre-signed URL

S3 Glacier Vault Lock

- Adopt a WORM (Write Once Read Many) model

- Create a Vault Lock Policy

- Lock the policy for future edits (can no longer be changed or deleted)

- Helpful for compliance and data retention

Object

Vault Lock Policy
Object can't be deleted
S3 Object Lock (versioning must be enabled)

- Adopt a WORM (Write Once Read Many) model
- Block an object version deletion for a specified amount of time
- **Retention mode - Compliance**:
  - Object versions can't be overwritten or deleted by any user, including the root user
  - Objects retention modes can't be changed, and retention periods can't be shortened
- **Retention mode - Governance:**
  - Most users can't overwrite or delete an object version or alter its lock settings
  - Some users have special permissions to change the retention or delete the object
- **Retention Period**: protect the object for a fixed period, it can be extended
- **Legal Hold:**
  - protect the object indefinitely, independent from retention period
  - can be freely placed and removed using the *s3:PutObjectLegalHold* IAM permission

S3 – Access Points
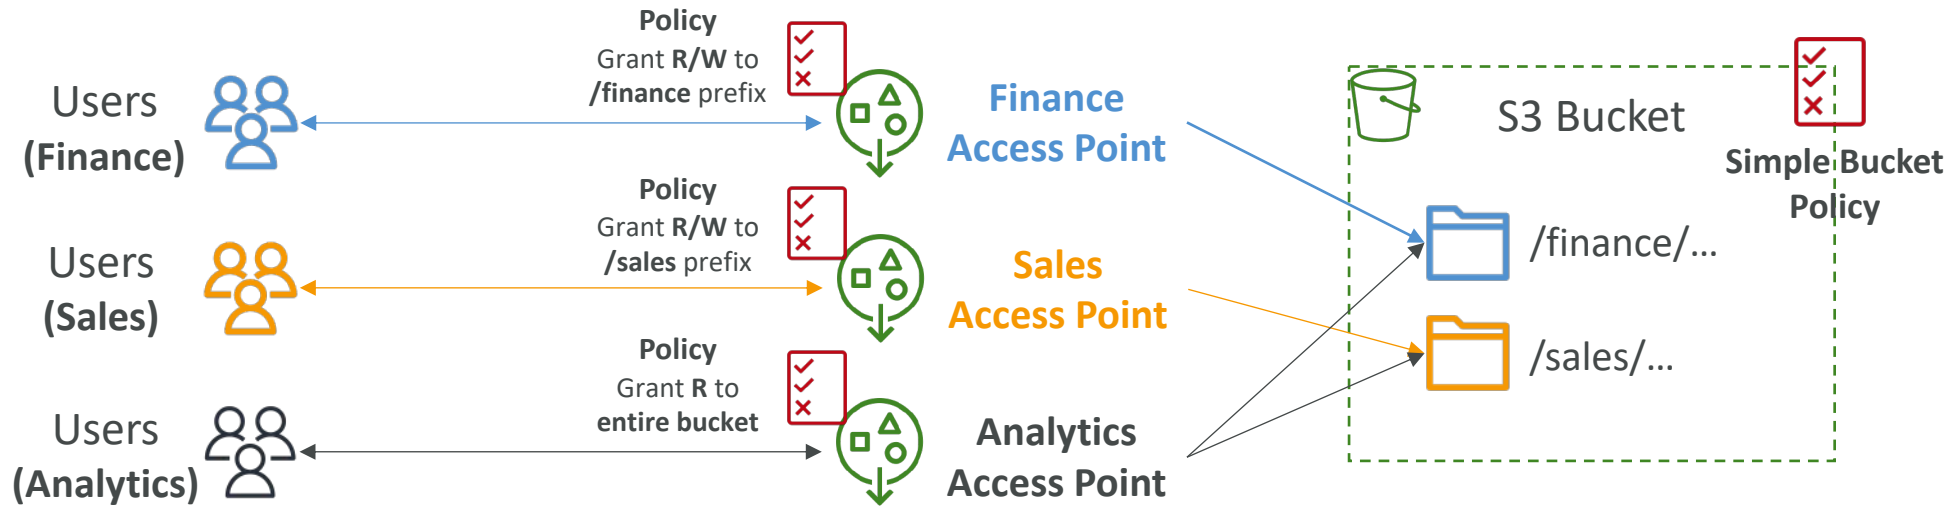

- Access Points simplify security management for S3 Buckets
- Each Access Point has:
  - its own DNS name (Internet Origin or VPC Origin)
  - an access point policy (similar to bucket policy) – manage security at scale

S3 – Access Points – VPC Origin

- We can define the access point to be accessible only from within the VPC
- You must create a VPC Endpoint to access the Access Point (Gateway or Interface Endpoint)
- The VPC Endpoint Policy must allow access to the target bucket and Access Point

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Principal": "*",
            "Action": [
                "s3:GetObject"
            ],
            "Effect": "Allow",
            "Resource": [
                "arn:aws:s3:::awsexamplebucket1/*",
                "arn:aws:s3:us-west-2:123456789012:accesspoint/example-vpc-ap/object/*"
            ]
        }
    ]
}
```
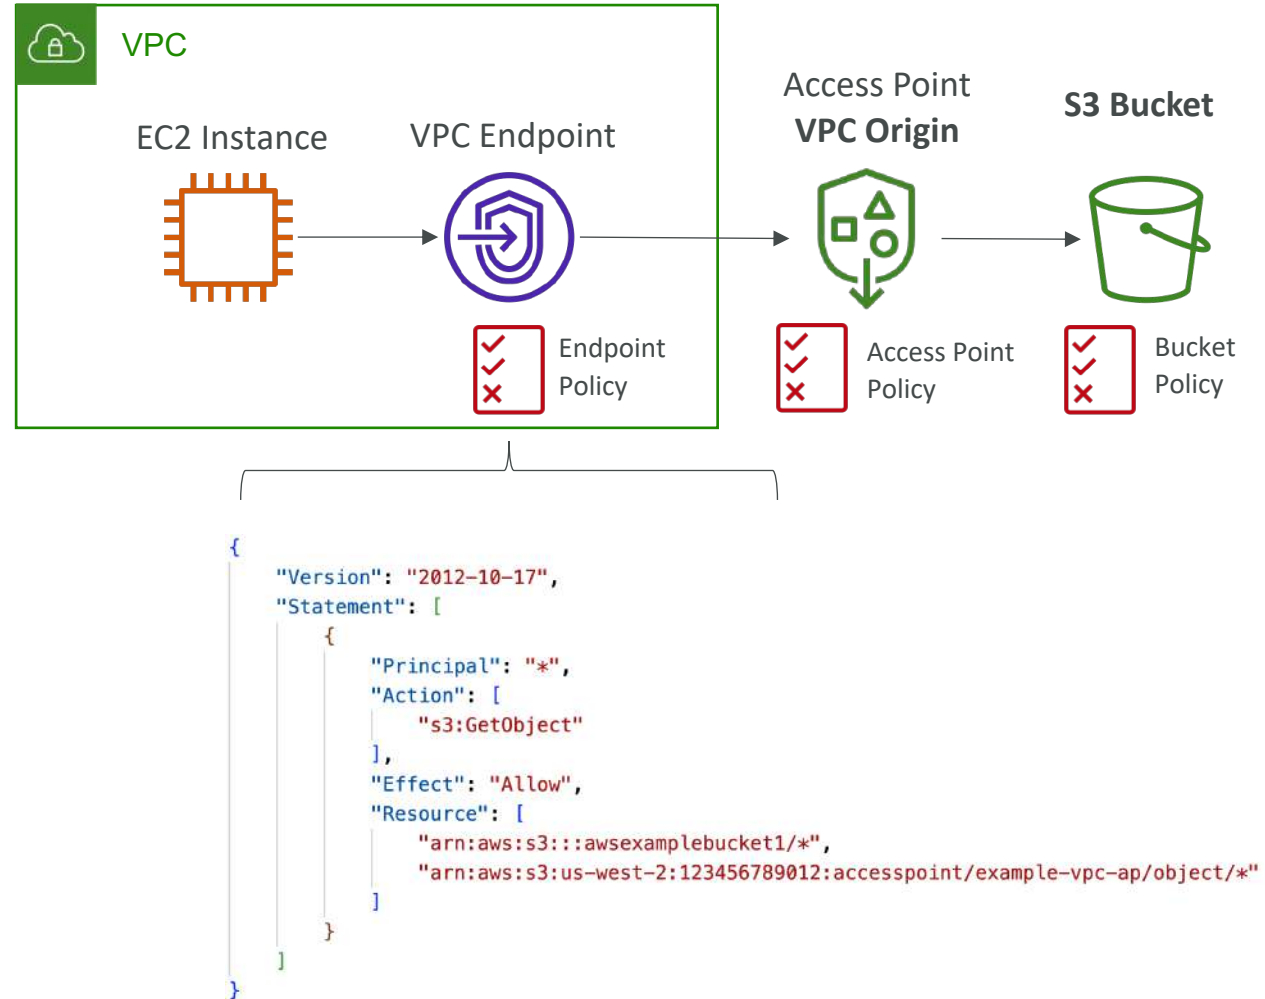

S3 – Multi-Region Access Points

- Provide a global endpoint that span S3 buckets in multiple AWS regions

- Dynamically route requests to the nearest S3 bucket (lowest latency)

- Bi-directional S3 bucket replication rules are created to keep data in sync across regions

- **Failover Controls** – allows you to shift requests across S3 buckets in different AWS regions within minutes (Active-Active or Active-Passive)

Advanced Storage Solutions

AWS Snow Family

- Highly-secure, portable devices to **collect and process data at the edge**, and **migrate data into and out of AWS**

Snowcone

Snowball Edge

	Snowcone	Snowball Edge
Storage Capacity	8 TB HDD - 14 TB SSD	80 TB - 210 TB
Migration Size	Up to terabytes	Up to petabytes

Data Migrations with AWS Snow Family

	Time to Transfer		
	100 Mbps	**1Gbps**	**10Gbps**
10 TB	12 days	30 hours	3 hours
100 TB	124 days	12 days	30 hours
1 PB	3 years	124 days	12 days

Challenges:
- Limited connectivity
- Limited bandwidth
- High network cost
- Shared bandwidth (can't maximize the line)
- Connection stability

AWS Snow Family: offline devices to perform data migrations

If it takes more than a week to transfer over the network, use Snowball devices!

Diagrams

- Direct upload to S3:

client   www: 10Gbit/s   **Amazon S3 bucket**

- With Snow Family:

client   **AWS Snowball**   ship   **AWS Snowball**   **import/ export**   **Amazon S3 bucket**
Snow Family – Usage Process

1. Request Snowball devices from the AWS console for delivery

2. Install the snowball client / AWS OpsHub on your servers

3. Connect the snowball to your servers and copy files using the client

4. Ship back the device when you're done (goes to the right AWS facility)

5. Data will be loaded into an S3 bucket

6. Snowball is completely wiped

What is Edge Computing?

- Process data while it's being created on **an edge location**
  - A truck on the road, a ship on the sea, a mining station underground...

- These locations may have limited internet and no access to computing power

- We setup a **Snowball Edge / Snowcone** device to do edge computing
  - Snowcone: 2 CPUs, 4 GB of memory, wired or wireless access
  - Snowball Edge Compute Optimized (dedicated for that use case) & Storage Optimized
  - Run EC2 Instances or Lambda functions at the edge

- Use cases: preprocess data, machine learning, transcoding media

Amazon FSx – Overview

- Launch 3rd party high-performance file systems on AWS
- Fully managed service

 FSx for Lustre

 FSx for Windows File Server

 FSx for NetApp ONTAP

 FSx for OpenZFS

Amazon FSx for Windows (File Server)

- **FSx for Windows** is a fully managed **Windows** file system share drive
- Supports SMB protocol & Windows NTFS
- Microsoft Active Directory integration, ACLs, user quotas
- **Can be mounted on Linux EC2 instances**
- Supports **Microsoft's Distributed File System (DFS) Namespaces** (group files across multiple FS)

- Scale up to 10s of GB/s, millions of IOPS, 100s PB of data
- Storage Options:
    - **SSD** – latency sensitive workloads (databases, media processing, data analytics, …)
    - **HDD** – broad spectrum of workloads (home directory, CMS, …)
- Can be accessed from your on-premises infrastructure (VPN or Direct Connect)
- Can be configured to be Multi-AZ (high availability)
- Data is backed-up daily to S3

Amazon FSx for Lustre

- Lustre is a type of parallel distributed file system, for large-scale computing
- The name Lustre is derived from "Linux" and "cluster

- Machine Learning, **High Performance Computing (HPC)**
- Video Processing, Financial Modeling, Electronic Design Automation
- Scales up to 100s GB/s, millions of IOPS, sub-ms latencies
- Storage Options:
  - **SSD** – low-latency, IOPS intensive workloads, small & random file operations
  - **HDD** – throughput-intensive workloads, large & sequential file operations
- **Seamless integration with S3**
  - Can "read S3" as a file system (through FSx)
  - Can write the output of the computations back to S3 (through FSx)
- **Can be used from on-premises servers (VPN or Direct Connect)**

FSx Lustre - File System Deployment Options

- Scratch File System
  - Temporary storage
  - Data is not replicated (doesn't persist if file server fails)
  - High burst (6x faster, 200MBps per TiB)
  - Usage: short-term processing, optimize costs

- Persistent File System
  - Long-term storage
  - Data is replicated within same AZ
  - Replace failed files within minutes
  - Usage: long-term processing, sensitive data
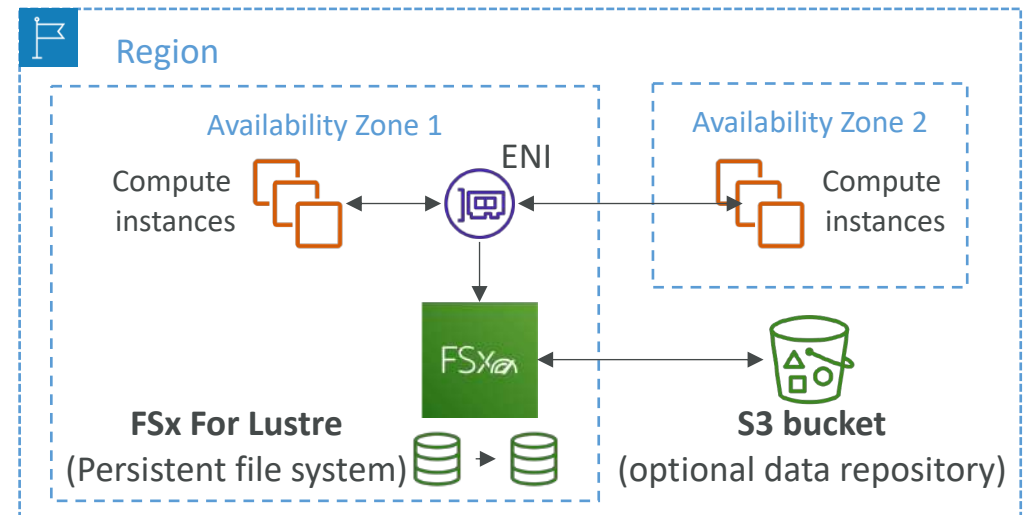

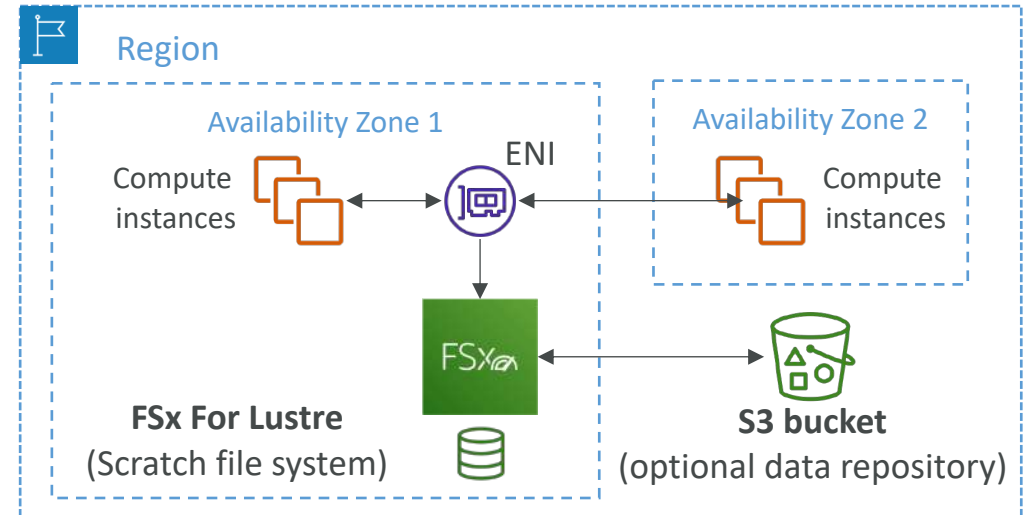

Amazon FSx for NetApp ONTAP

- Managed NetApp ONTAP on AWS
- **File System compatible with NFS, SMB, iSCSI protocol**
- Move workloads running on ONTAP or NAS to AWS
- Works with:
  - Linux
  - Windows
  - MacOS
  - VMware Cloud on AWS
  - Amazon Workspaces & AppStream 2.0
  - Amazon EC2, ECS and EKS
- Storage shrinks or grows automatically
- Snapshots, replication, low-cost, compression and data de-duplication
- **Point-in-time instantaneous cloning (helpful for testing new workloads)**

Amazon FSx for NetApp ONTAP FS

NFS, SMB, iSCSI

EC2

ECS

EKS

Windows
macOS

VMware Cloud on AWS

Amazon AppStream 2.0

Amazon WorkSpaces

On-premises Server
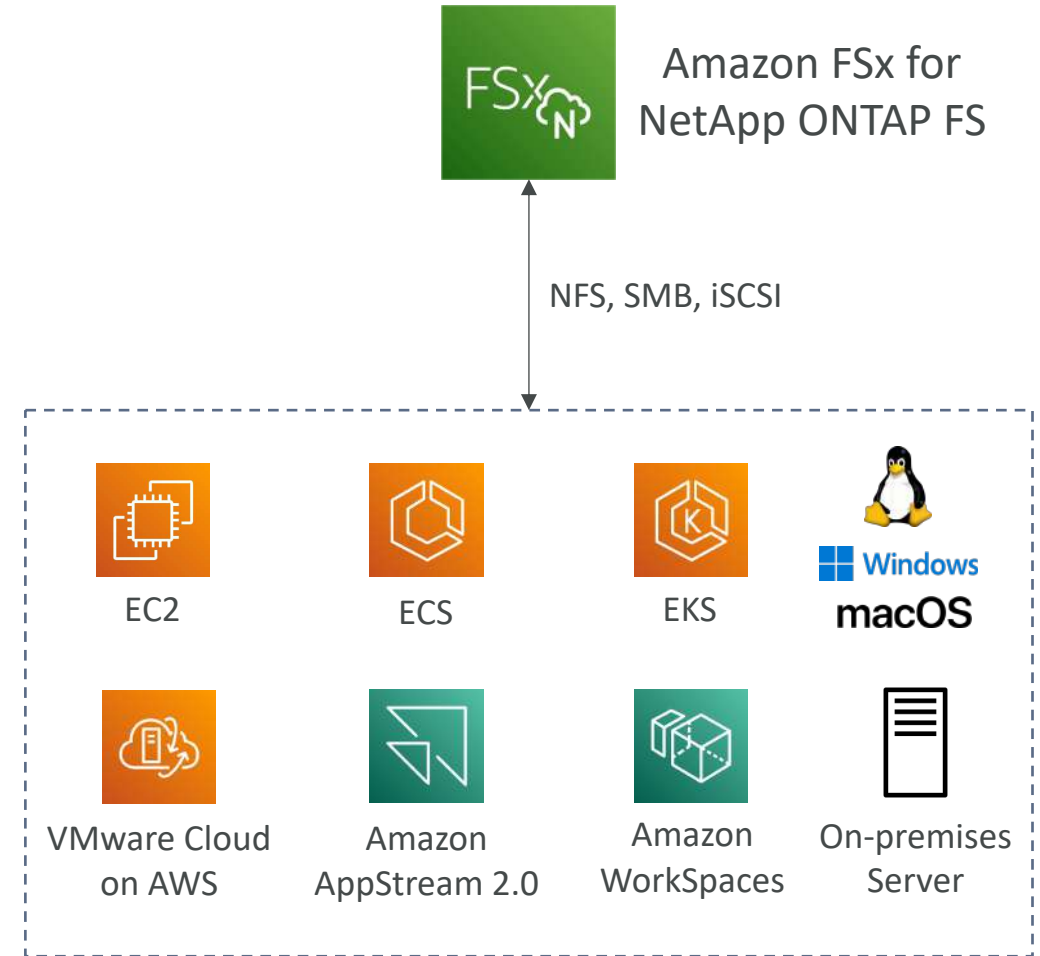

Amazon FSx for OpenZFS

- Managed OpenZFS file system on AWS
- File System compatible with NFS (v3, v4, v4.1, v4.2)
- Move workloads running on ZFS to AWS
- Works with:
  - Linux
  - Windows
  - MacOS
  - VMware Cloud on AWS
  - Amazon Workspaces & AppStream 2.0
  - Amazon EC2, ECS and EKS
- Up to 1,000,000 IOPS with < 0.5ms latency
- Snapshots, compression and low-cost
- **Point-in-time instantaneous cloning (helpful for testing new workloads)**

Amazon FSx for OpenZFS

NFS (v3, v4, v4.1, v4.2)

EC2   ECS   EKS   Windows / macOS

VMware Cloud on AWS   Amazon AppStream 2.0   Amazon WorkSpaces   On-premises Server
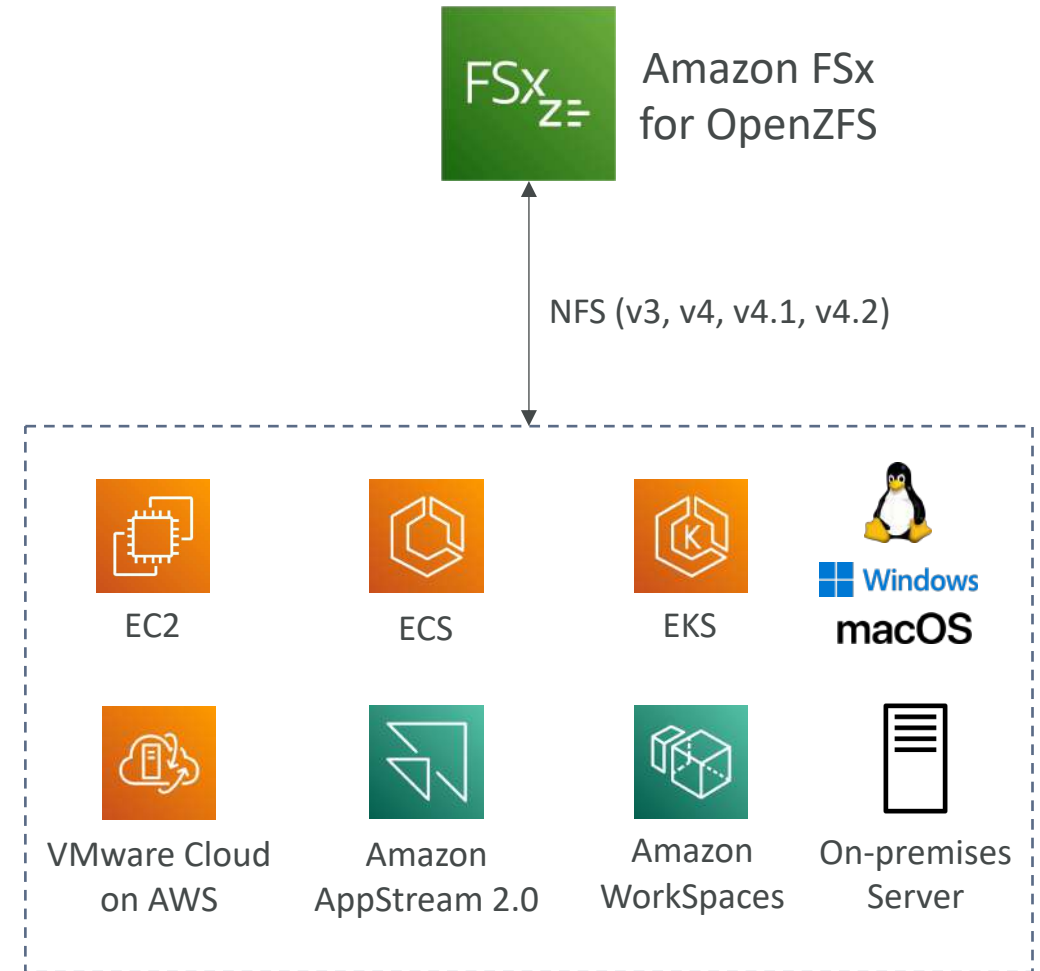

FSx for SysOps

- **FSx for Windows – Single-AZ**
  - Automatically replicates data within an AZ
  - Two generations: Single-AZ 1 (SSD), Single-AZ 2 (SSD & HDD)
- **FSx for Windows – Multi-AZ**
  - Automatically replicates data across AZs (synchronous)
  - Standby file server in a different AZ (automatic failover)
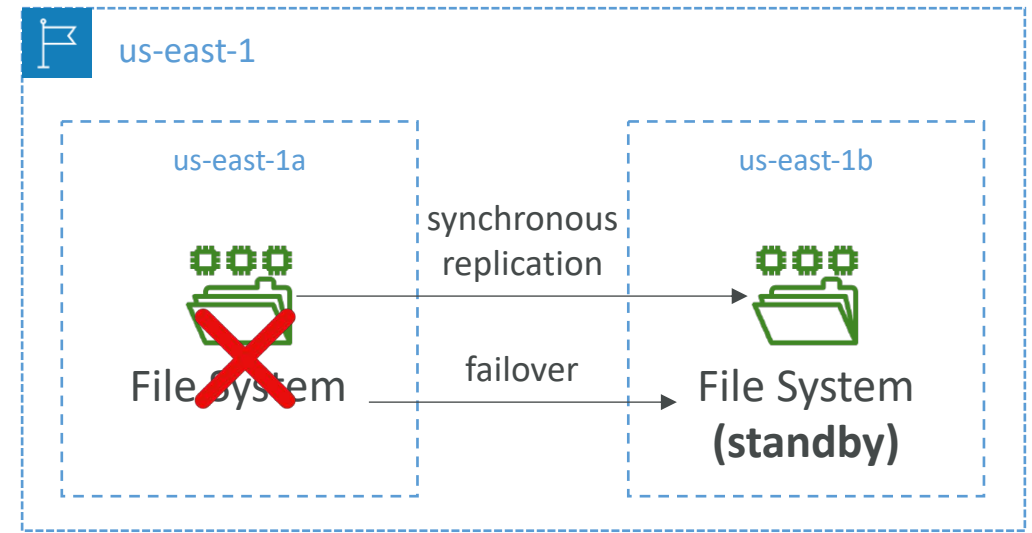

Hybrid Cloud for Storage

- AWS is pushing for "hybrid cloud"
  - Part of your infrastructure is on the cloud
  - Part of your infrastructure is on-premises

- This can be due to
  - Long cloud migrations
  - Security requirements
  - Compliance requirements
  - IT strategy

- S3 is a proprietary storage technology (unlike EFS / NFS), so how do you expose the S3 data on-premises?

- AWS Storage Gateway!

AWS Storage Cloud Native Options

Block

Amazon EBS
EC2 Instance Store

File

Amazon EFS

Amazon FSx

Object

Amazon S3

Amazon Glacier

AWS Storage Gateway

- Bridge between on-premises data and cloud data
- Use cases:
  - disaster recovery
  - backup & restore
  - tiered storage
  - on-premises cache & low-latency files access
- Types of Storage Gateway:
  - S3 File Gateway
  - FSx File Gateway
  - Volume Gateway
  - Tape Gateway

Storage Gateway
Amazon S3 File Gateway

- Configured S3 buckets are accessible using the NFS and SMB protocol
- **Most recently used data is cached in the file gateway**
- Supports S3 Standard, S3 Standard IA, S3 One Zone A, S3 Intelligent Tiering
- **Transition to S3 Glacier using a Lifecycle Policy**
- Bucket access using IAM roles for each File Gateway
- SMB Protocol has integration with Active Directory (AD) for user authentication
Amazon FSx File Gateway

- Native access to Amazon FSx for Windows File Server
- **Local cache for frequently accessed data**
- Windows native compatibility (SMB, NTFS, Active Directory...)
- Useful for group file shares and home directories

© Stephane Maarek

Volume Gateway

- Block storage using iSCSI protocol backed by S3
- Backed by EBS snapshots which can help restore on-premises volumes!
- **Cached volumes:** low latency access to most recent data
- **Stored volumes:** entire dataset is on premise, scheduled backups to S3
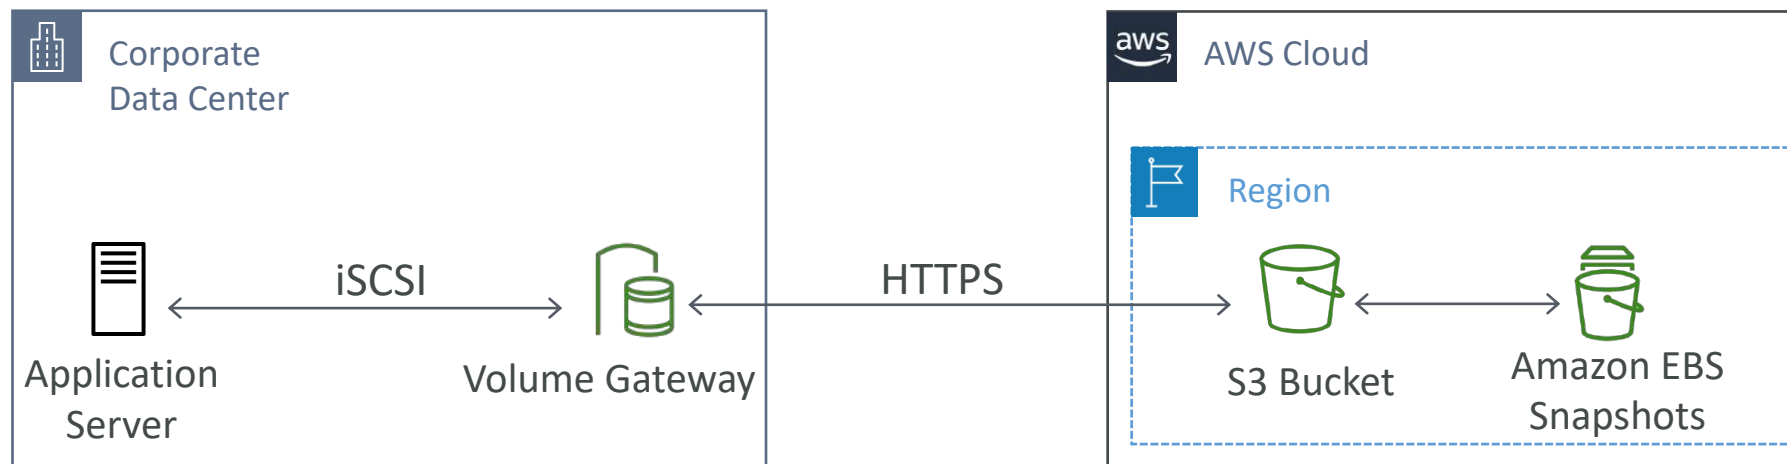

Tape Gateway

- Some companies have backup processes using physical tapes (!)
- With Tape Gateway, companies use the same processes but, in the cloud
- Virtual Tape Library (VTL) backed by Amazon S3 and Glacier
- Back up data using existing tape-based processes (and iSCSI interface)
- Works with leading backup software vendors
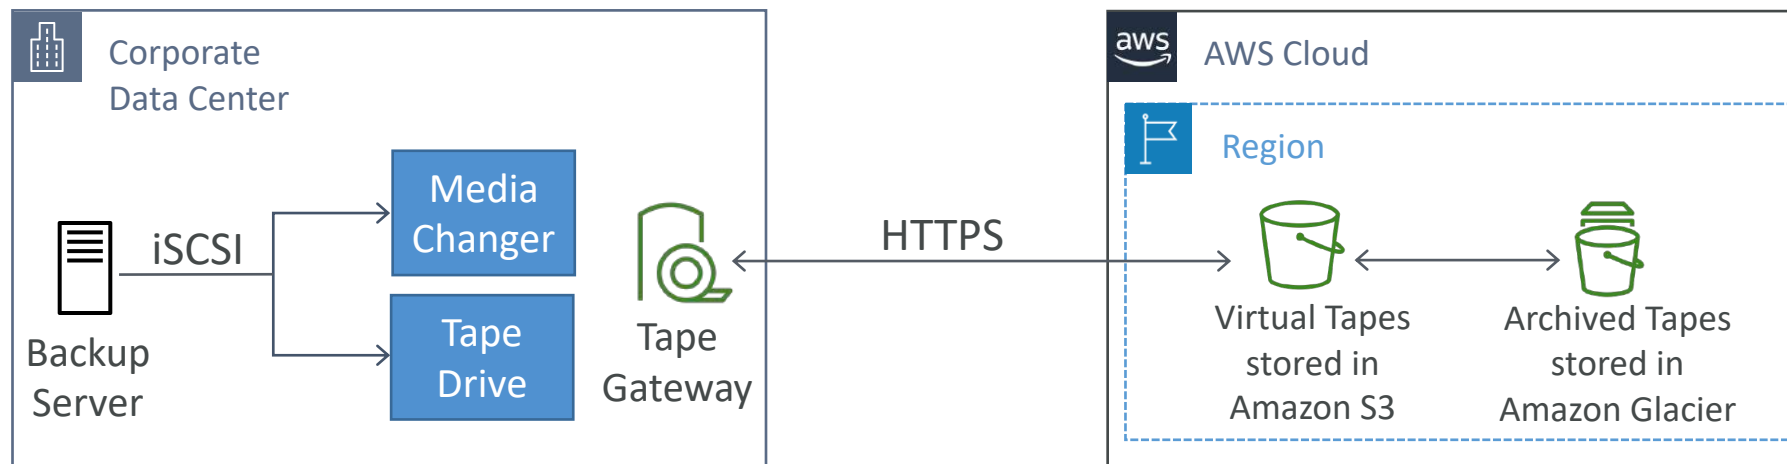

Storage Gateway – Hardware appliance

- Using Storage Gateway means you need on-premises virtualization

- Otherwise, you can use a **Storage Gateway Hardware Appliance**

- You can buy it on amazon.com

- Works with File Gateway, Volume Gateway, Tape Gateway

- Has the required CPU, memory, network, SSD cache resources

- Helpful for daily NFS backups in small data centers

Select host platform

○ **VMware ESXi**

○ **Microsoft Hyper-V 2012R2/2016**

○ **Linux KVM**

○ **Amazon EC2**

● Hardware Appliance | ⧉ Buy on Amazon | Activate Appliance

AWS Storage Gateway
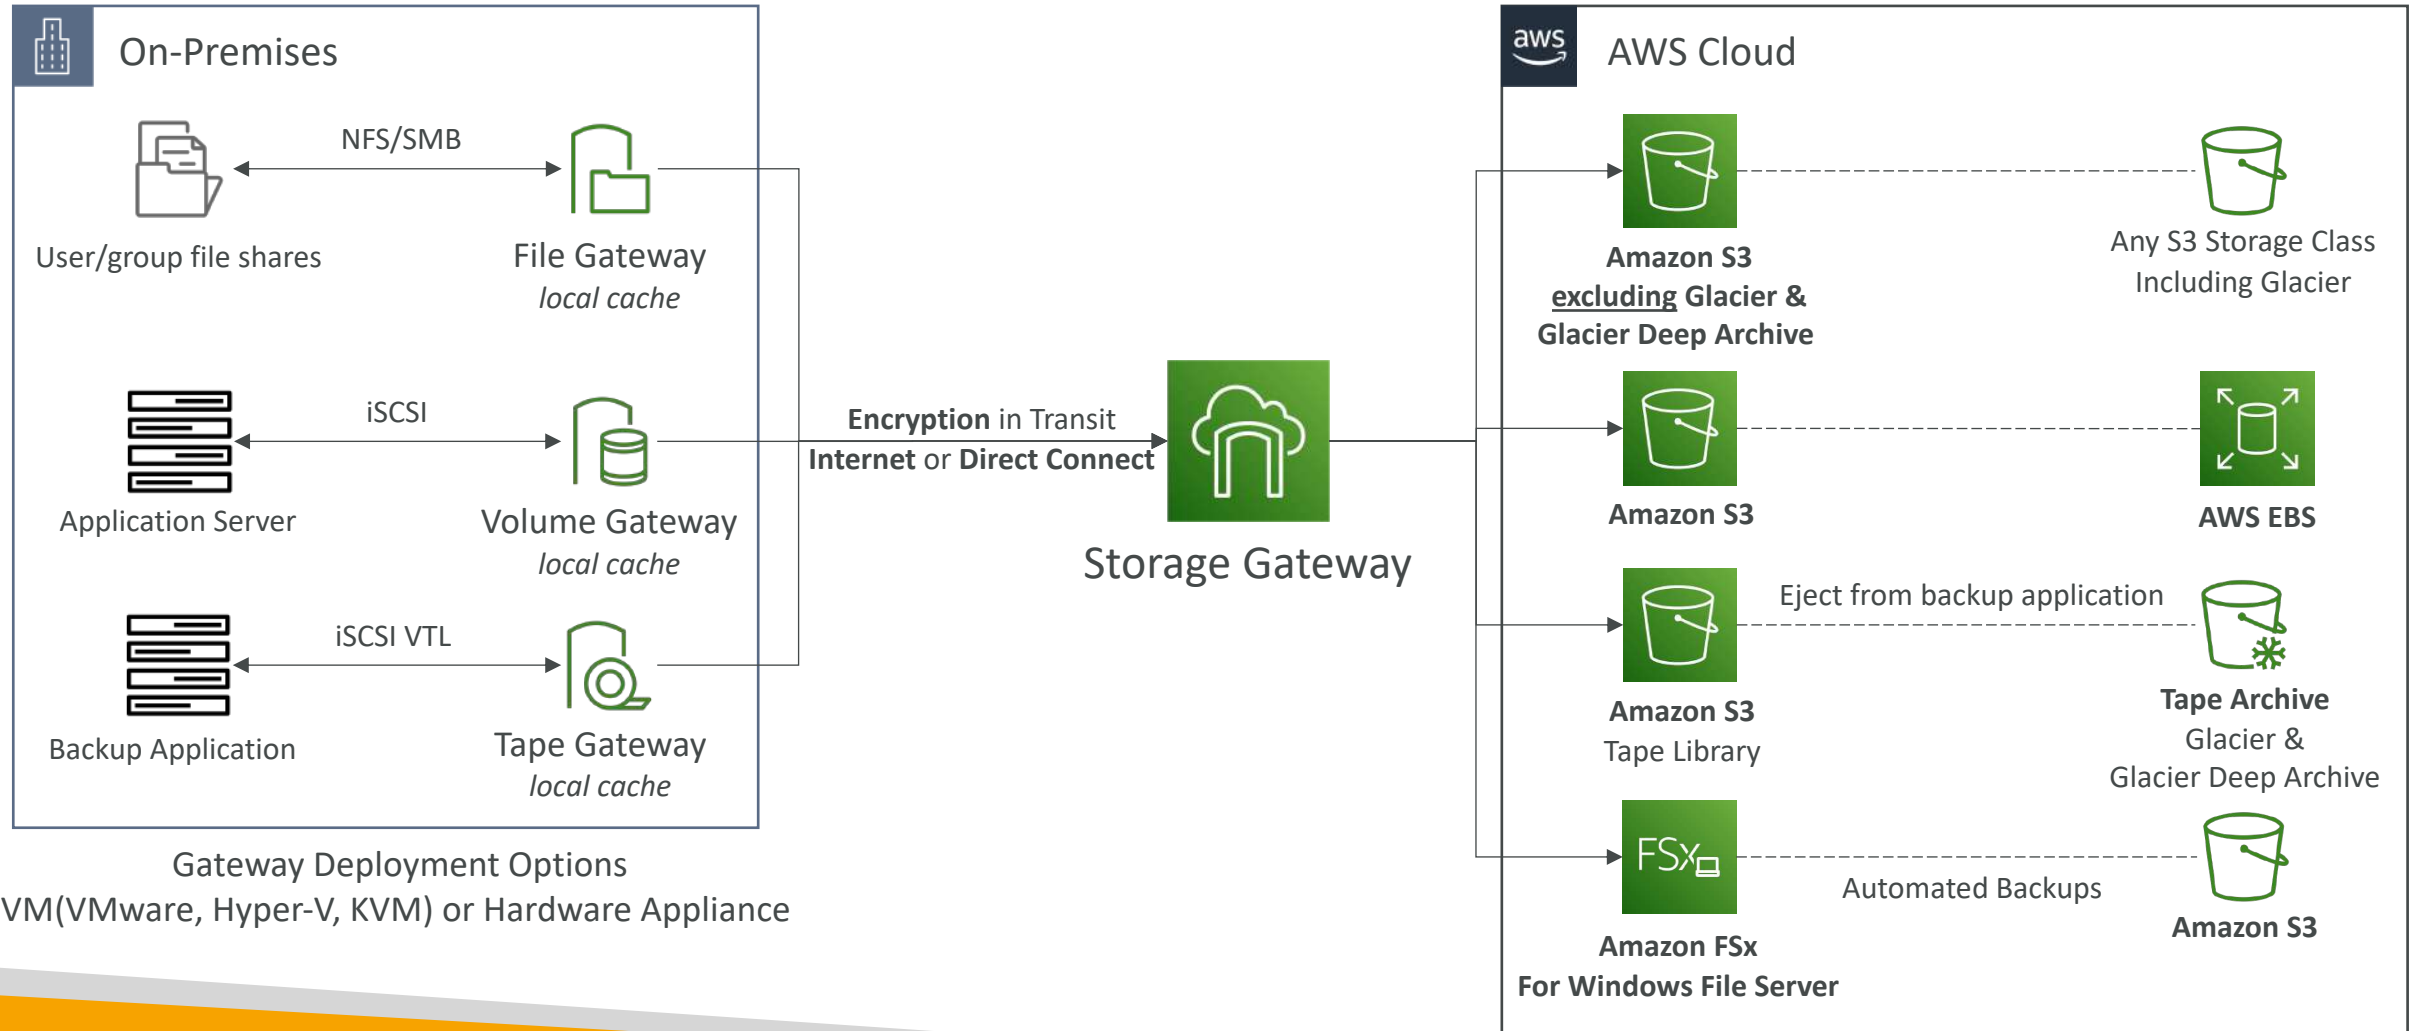

Amazon FSx File Gateway

- Native access to Amazon FSx for Windows File Server
- **Local cache for frequently accessed data**
- Windows native compatibility (SMB, NFTS, Active Directory...)
- Useful for group file shares and home directories

SMB Clients

Corporate Data Center

Amazon FSx File Gateway

AWS Cloud

Amazon FSx for Windows File Server

File systems

Storage Gateway – SysOps

- File Gateway is POSIX compliant (Linux file system)
  - POSIX metadata ownership, permissions, and timestamps stored in the object's metadata in S3

- Reboot Storage Gateway VM: (e.g., maintenance)
  - **File Gateway:** simply restart the Storage Gateway VM
  - **Volume and Tape Gateway:**
    - Stop Storage Gateway Service (AWS Console, VM local Console, Storage Gateway API)
    - Reboot the Storage Gateway VM
    - Start Storage Gateway Service (AWS Console, VM local Console, Storage Gateway API)

Storage Gateway – Activations

- Two ways to get Activation Key:
  - Using the Gateway VM CLI
  - Make a web request to the Gateway VM (Port 80)
- Troubleshooting Activation Failures:
  - Make sure the Gateway VM has port 80 opened
  - Check that the Gateway VM has the correct time and synchronizing its time automatically to a Network Time Protocol (NTP) server

```
AWS Appliance Activation – Configuration

##################################################################
##  Currently connected network adapters:
##
##  eth0:
##################################################################

1: HTTP/SOCKS Proxy Configuration
2: Network Configuration
3: Test Network Connectivity
4: View System Resource Check (0 Errors)
5: License Information
6: Command Prompt

0: Get activation key

Press "x" to exit session

Enter command:
```

curl
'*vm_ip_address*/?activationRegion=
activation_region&no_redirect'

Storage Gateway – Volume Gateway Cache

- Cached mode: only the most recent data is stored
- Looking at cache efficiency
  - Look at the CacheHitPercent metric (you want it to be high)
  - Look at the CachePercentUsed (you don't want it to be too high)
- Create a larger cache disk
  - Use the cached volume to clone a new volume of a larger size
  - Select the new disk as the cached volume

aws — AWS Cloud

S3 Bucket

Cache Miss

CacheHitPercent: 30%

Corporate Data Center

Cache Hit

CACHE — Cached Volume Gateway

Client
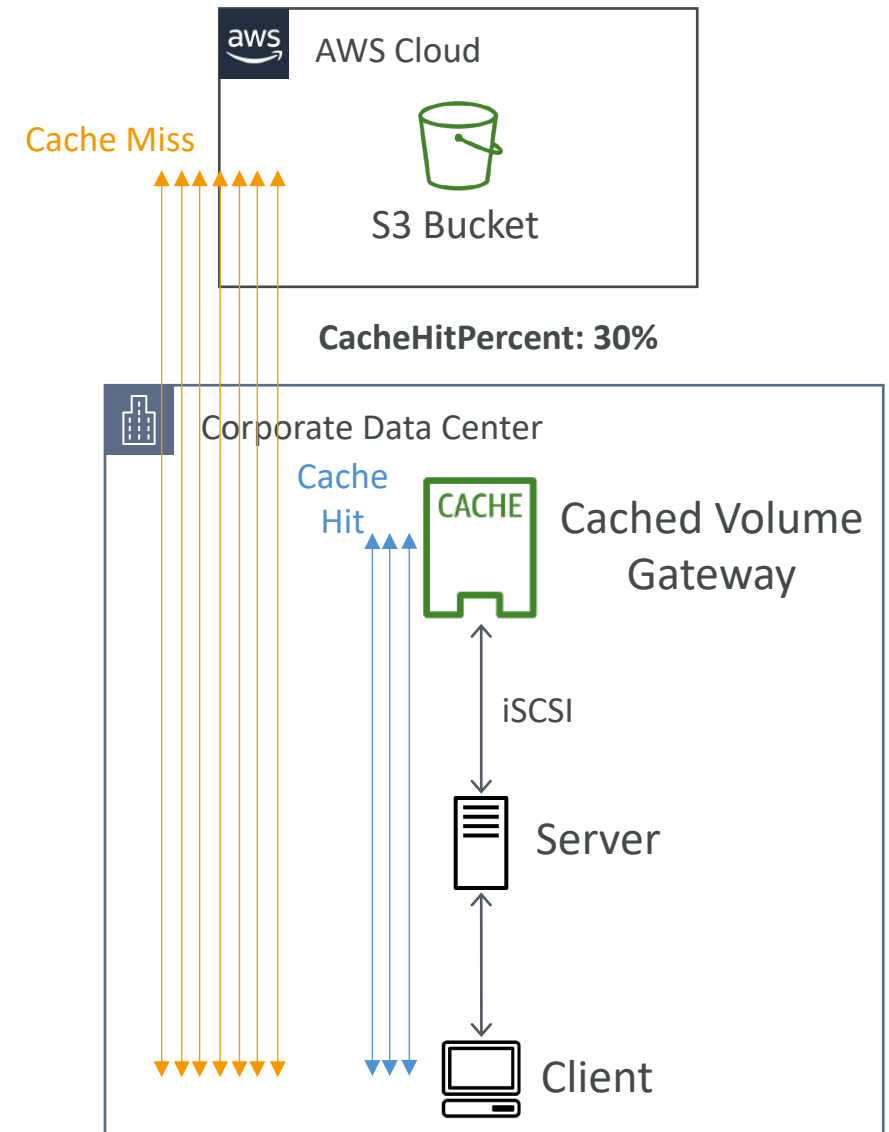

Amazon CloudFront

Amazon CloudFront

- Content Delivery Network (CDN)
- **Improves read performance, content is cached at the edge**
- Improves users experience
- 216 Point of Presence globally (edge locations)
- DDoS protection (because worldwide), integration with Shield, AWS Web Application Firewall

Source: https://aws.amazon.com/cloudfront/features/?nc=sn&loc=2
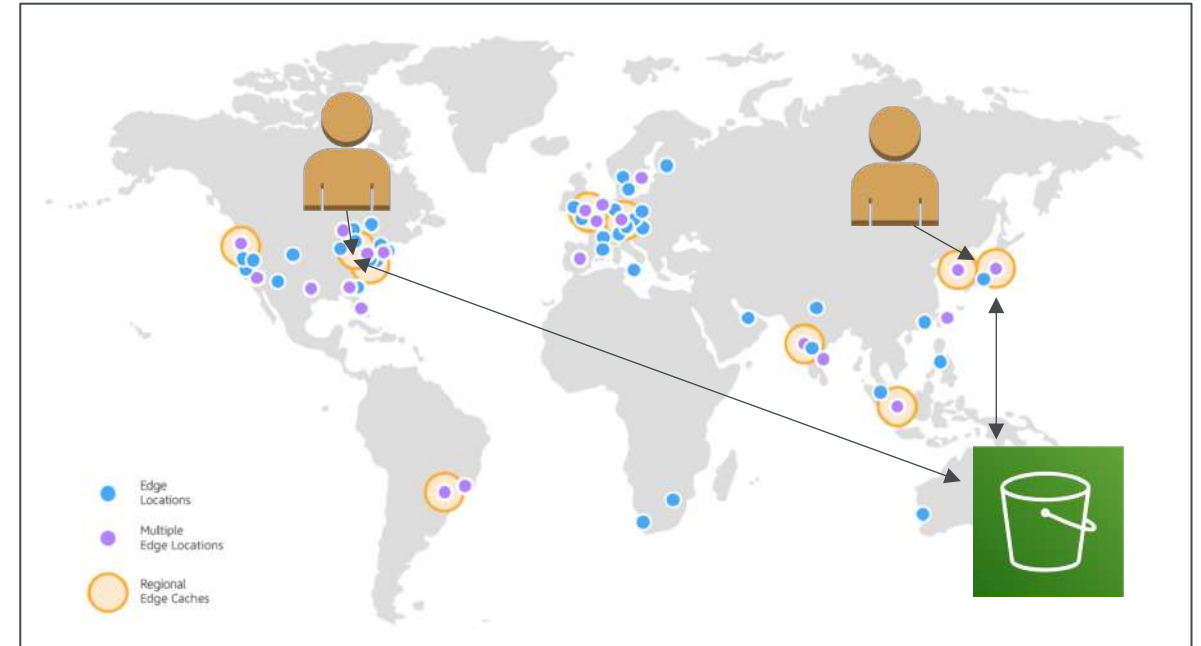

CloudFront – Origins

- S3 bucket
  - For distributing files and caching them at the edge
  - Enhanced security with CloudFront **Origin Access Control (OAC)**
  - OAC is replacing Origin Access Identity (OAI)
  - CloudFront can be used as an ingress (to upload files to S3)

- Custom Origin (HTTP)
  - Application Load Balancer
  - EC2 instance
  - S3 website (must first enable the bucket as a static S3 website)
  - Any HTTP backend you want

CloudFront at a high level

GET /beach.jpg?size=300x300 HTTP/1.1
User-Agent: Mozilla/4.0 (compatible; MSIE5.01; Windows NT)
Host: www.example.com
Accept-Encoding: gzip, deflate

Local Cache

Origin

S3

or

HTTP
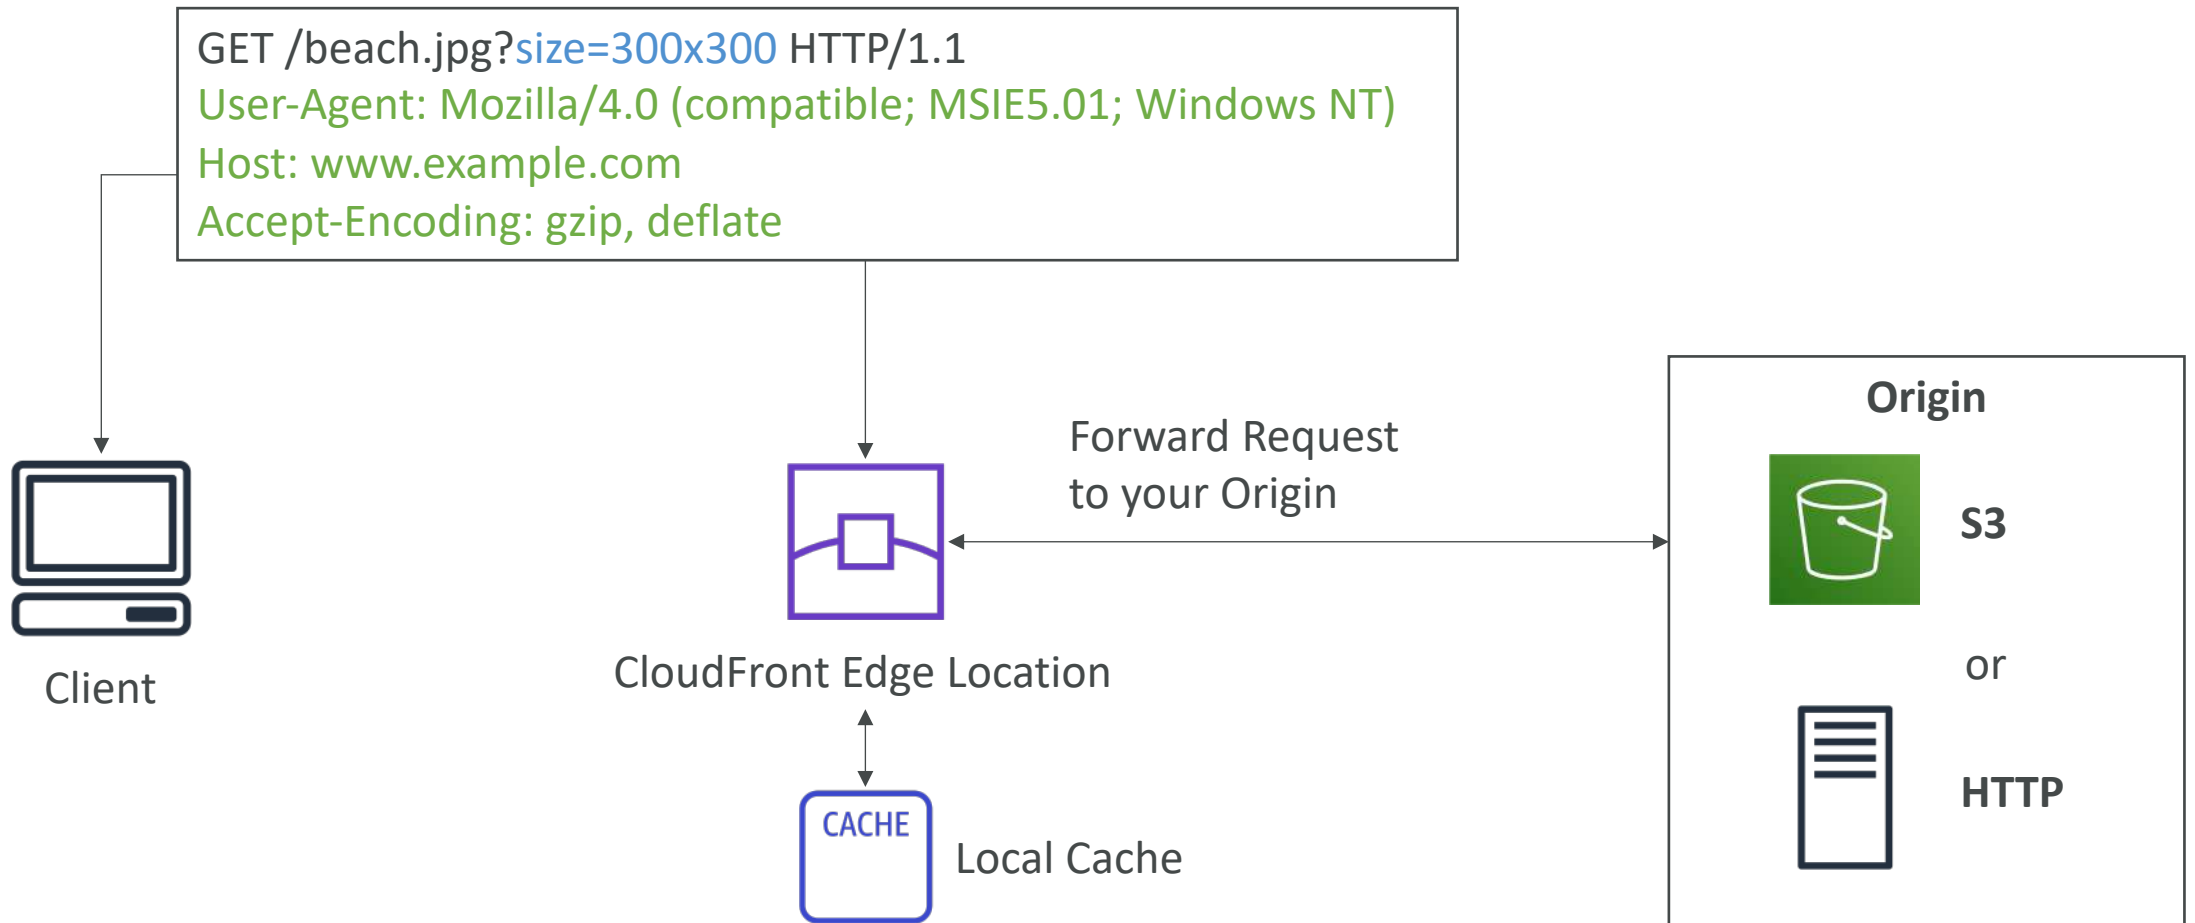

CloudFront – S3 as an Origin
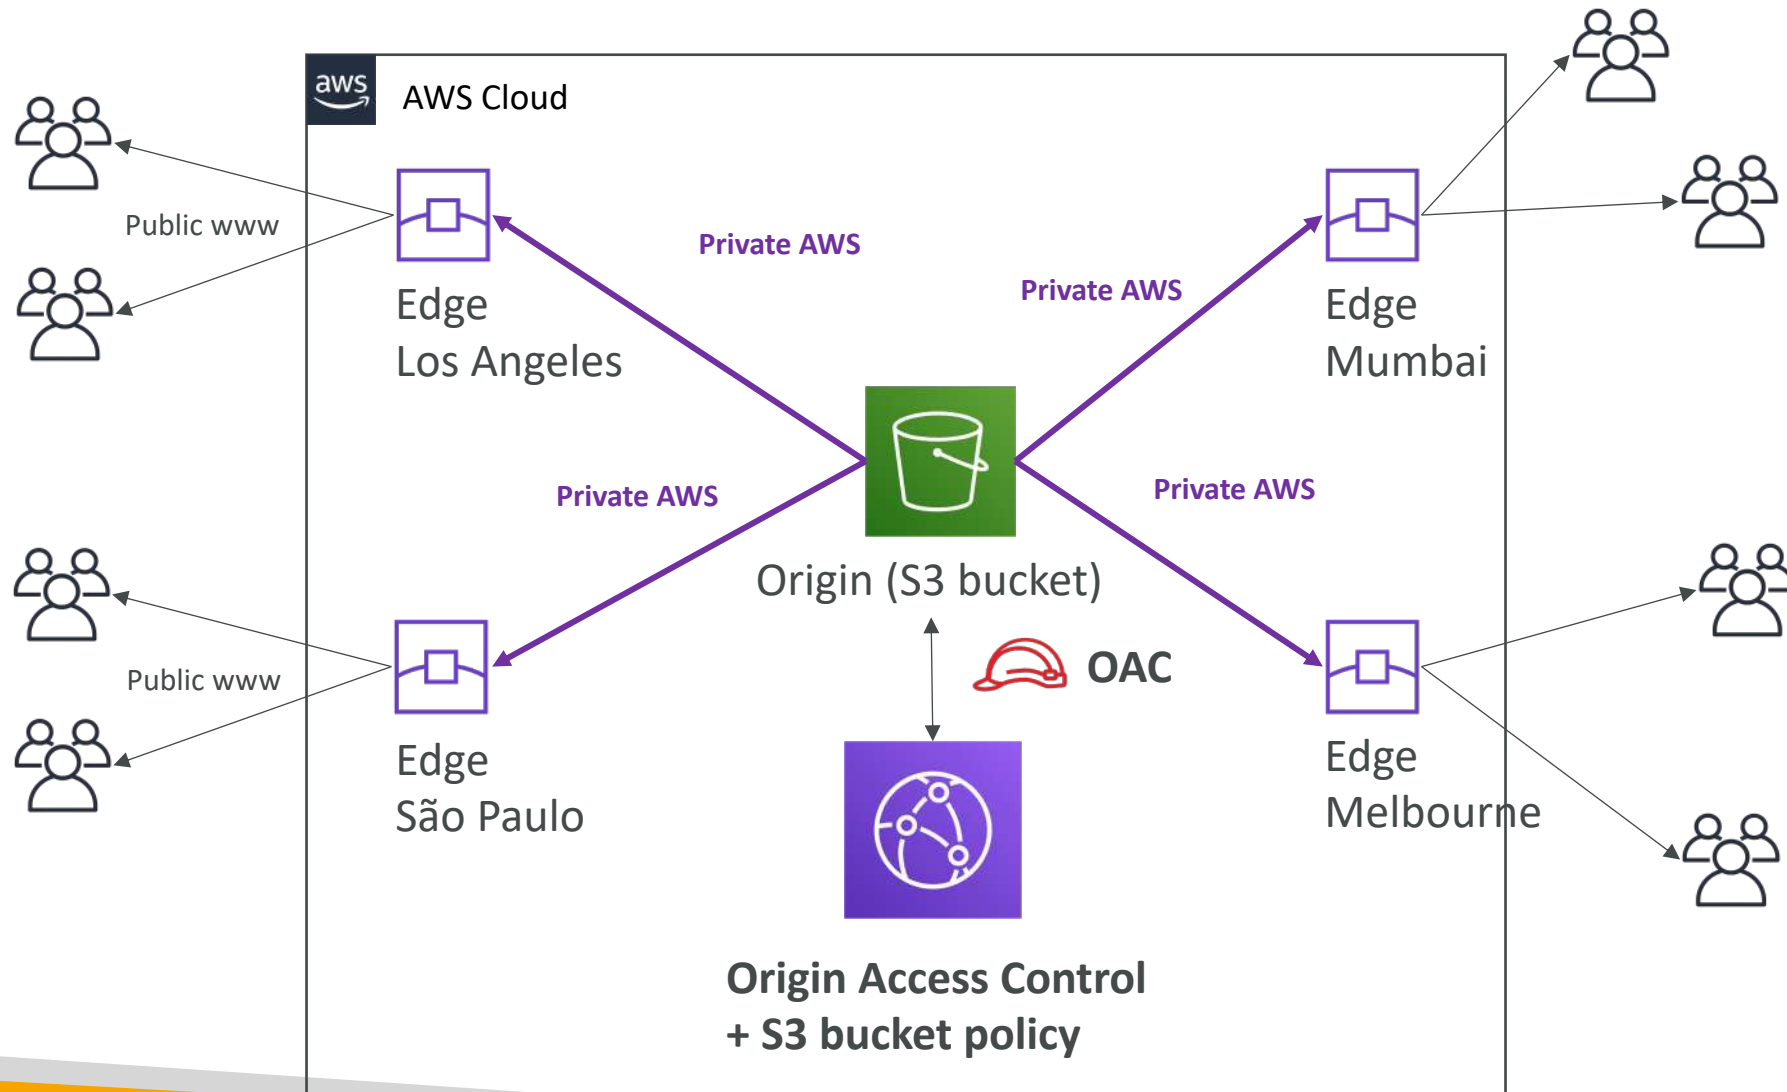

CloudFront vs S3 Cross Region Replication

- CloudFront:
  - Global Edge network
  - Files are cached for a TTL (maybe a day)
  - **Great for static content that must be available everywhere**

- S3 Cross Region Replication:
  - Must be setup for each region you want replication to happen
  - Files are updated in near real-time
  - Read only
  - **Great for dynamic content that needs to be available at low-latency in few regions**

CloudFront – ALB or EC2 as an origin

CloudFront Geo Restriction

- You can restrict who can access your distribution
  - **Allowlist:** Allow your users to access your content only if they're in one of the countries on a list of approved countries.
  - **Blocklist:** Prevent your users from accessing your content if they're in one of the countries on a list of banned countries.

- The "country" is determined using a 3rd party Geo-IP database

- Use case: Copyright Laws to control access to content

CloudFront Access Logs

- Logs every request made to CloudFront into a logging S3 bucket
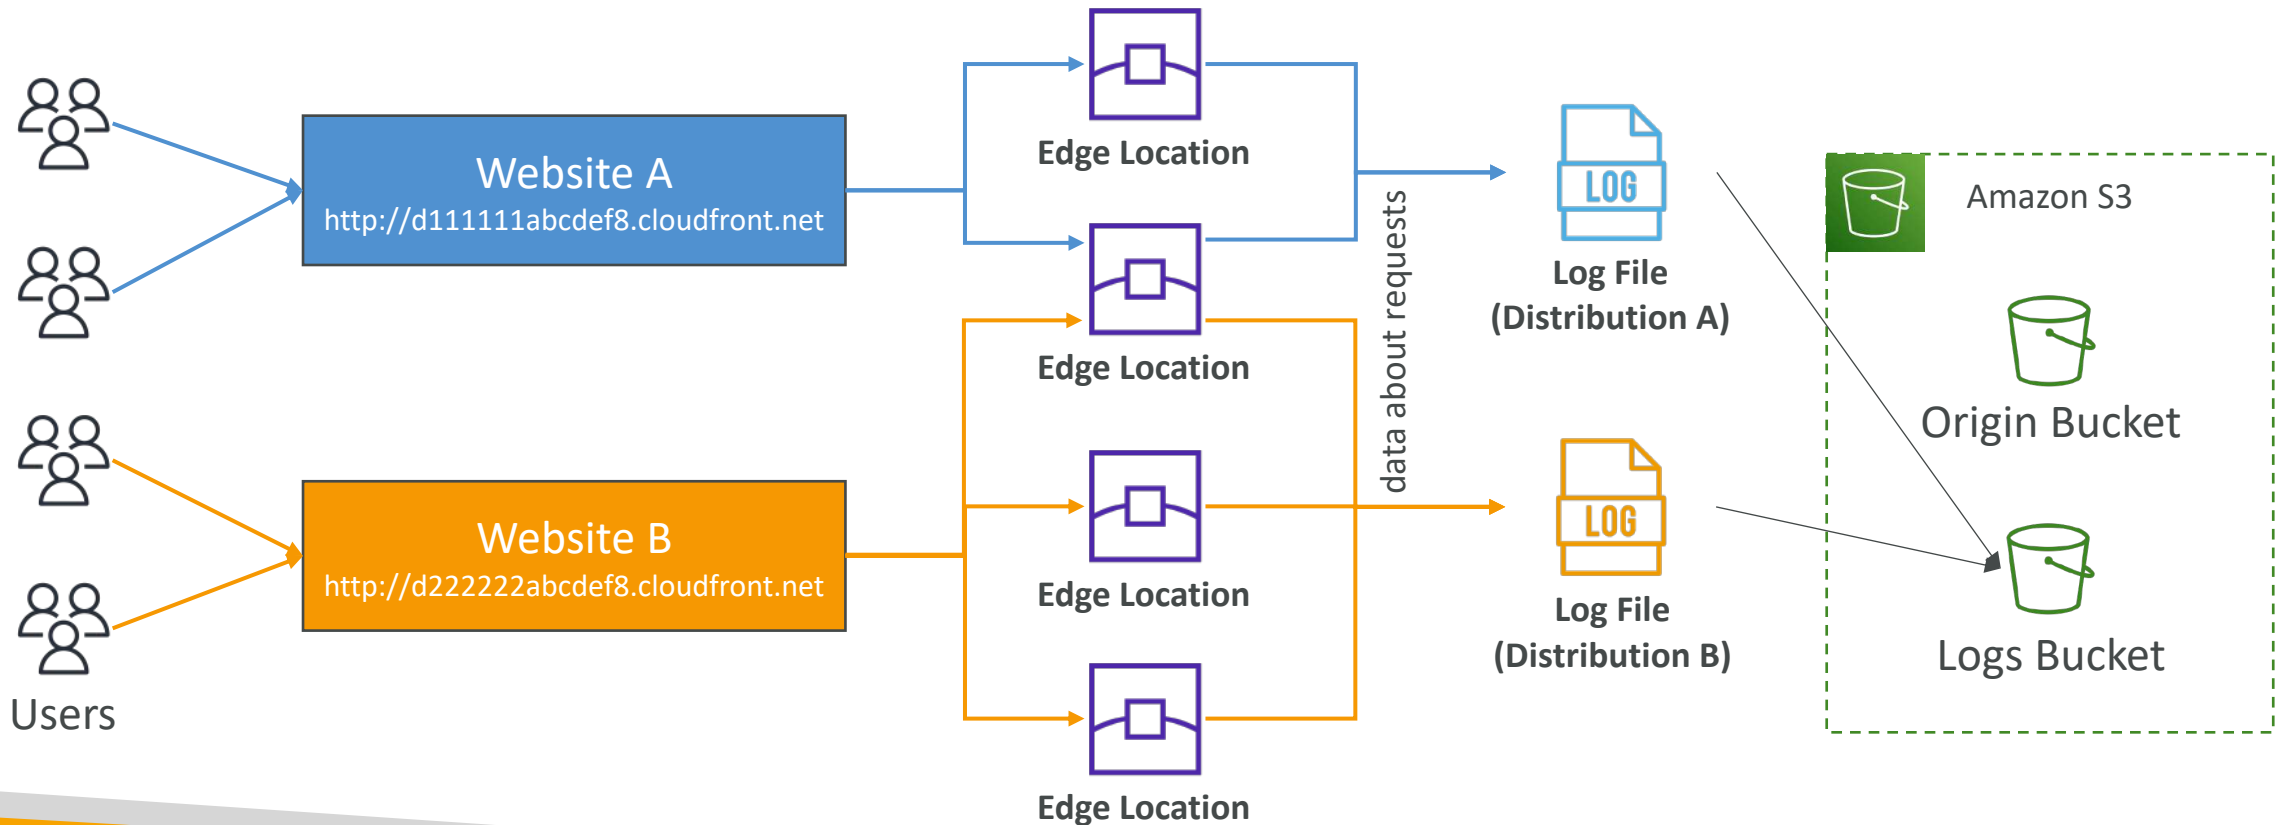

CloudFront Reports

- It's possible to generate reports on:
  - Cache Statistics Report
  - Popular Objects Report
  - Top Referrers Report
  - Usage Reports
  - Viewers Report

- These reports are based on the data from the Access Logs.

CloudFront troubleshooting

- CloudFront caches HTTP 4xx and 5xx status codes returned by S3 (or the origin server)

- 4xx error code indicates that user doesn't have access to the underlying bucket (403) or the object user is requesting is not found (404)

- 5xx error codes indicates Gateway issues

CloudFront Caching

- Cache based on
  - Headers
  - Session Cookies
  - Query String Parameters
- The cache lives at each CloudFront **Edge Location**
- You want to maximize the cache hit rate to minimize requests on the origin
- Control the TTL (0 seconds to 1 year), can be set by the origin using the Cache-Control header, Expires header…
- You can invalidate part of the cache using the **CreateInvalidation** API

Client

Request

Origin

forwards

Edge Location

Check / Update cache
Based on Headers / Cookies

CACHE

Expire based on TTL
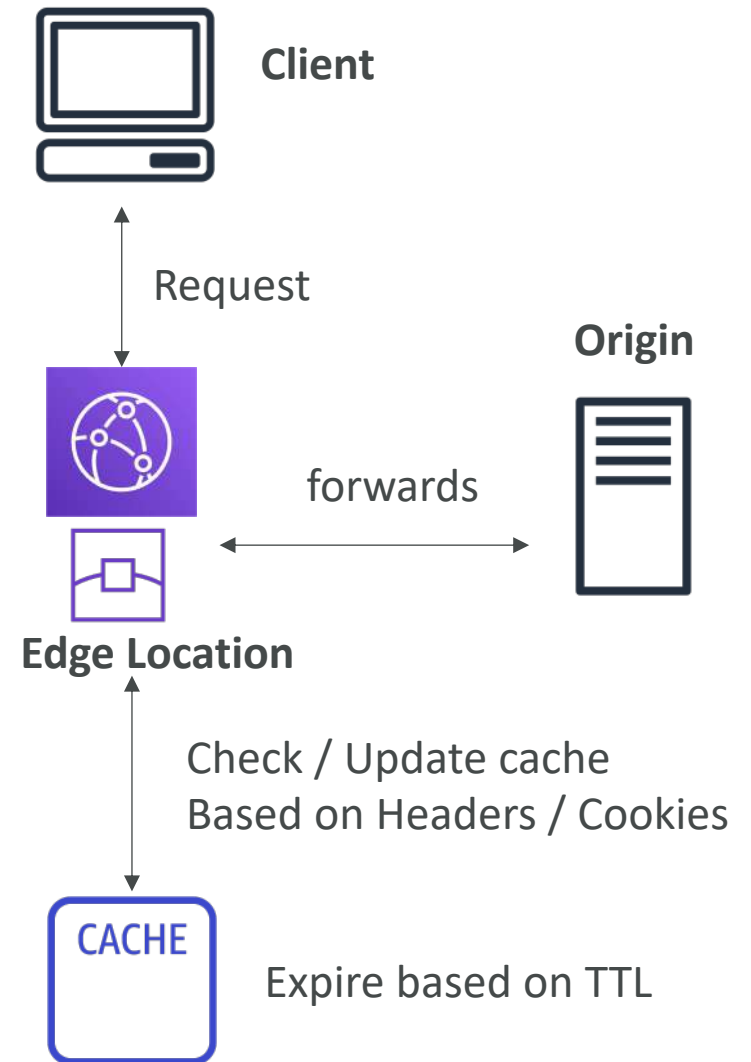

CloudFront Cache Behaviour for Headers

```
GET /image/cat.jpg   HTTP/1.1
Host: pics.mywebsite.com
User-Agent: Mozilla/5.0 (Mac OS X 10_15_2....)
Date: Tue, 28 Jan 2020 17:01:57 GMT
Authorization: SAPISIDHASH fdd00ecee39fe....
Keep-Alive: 300
Accept-Ranges: bytes
```

Request

Client
1. Forward all headers to your origin
   - => no caching, every request to origin
   - => TTL must be set to 0

2. Forward a whitelist of headers
   - caching based on values in all the specified headers

3. (None) == Forward only the default headers
   - no caching based on request headers
   - Best caching performance

CloudFront Caching – Whitelist Headers

GET /image/cat.jpg HTTP/1.1
Host: pics.mywebsite.com
User-Agent: Mozilla/5.0 (Mac OS X 10_15_2....)
Date: Tue, 28 Jan 2020 17:01:57 GMT
Authorization: SAPISIDHASH fdd00ecee39fe....
Keep-Alive: 300
Accept-Ranges: bytes

Better caching because less headers values

whitelisting

Request

Client

Edge Location

forward

Origin

CACHE

Cache based on Host & Authorization

CloudFront Origin Headers vs Cache Behavior

- Origin Custom Headers:
  - Origin-level setting
  - Set a **constant** header / header value for all requests to origin
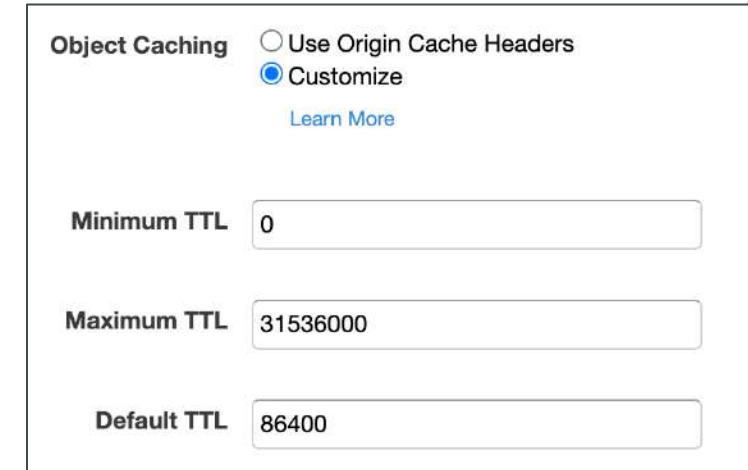

- Behavior setting:
  - Cache-related settings
  - Contains the whitelist of headers to forward

CloudFront Caching TTL

- ''Cache-Control: max-age'' is preferred to ''Expires'' header

- If the origin always sends back the header Cache-Control , then you can set the TTL to be controlled only by that header

- In case you want to set min/max boundaries, you choose ''customize'' for the Object Caching setting

- In case the Cache-Control header is missing, it will default to ''default value''

Object Caching	○ Use Origin Cache Headers
	● Customize
	Learn More
Minimum TTL	0
Maximum TTL	31536000
Default TTL	86400

Cache-Control
(optional)

Min. TTL   Default TTL   Max. TTL

Request

Client
Cookies is a specific request header

1. Default: do not process the cookies
    - Caching is not based on cookies
    - Cookies are not forwarded
2. Forward a whitelist of cookies
    - caching based on values in all the specified cookies
3. Forward all cookies
    - Worst caching performance

CloudFront Caching – Cookies

Better caching because less cookies values

GET /image/cat.jpg   HTTP/1.1

…

Cookie: username=John Doe; location=uk;

  lang = eng; user_id = 12342

…

GET /image/cat.jpg   HTTP/1.1

…

Cookie: user_id = 12342

…

Whitelisting

CACHE

Cache based on size

Origin
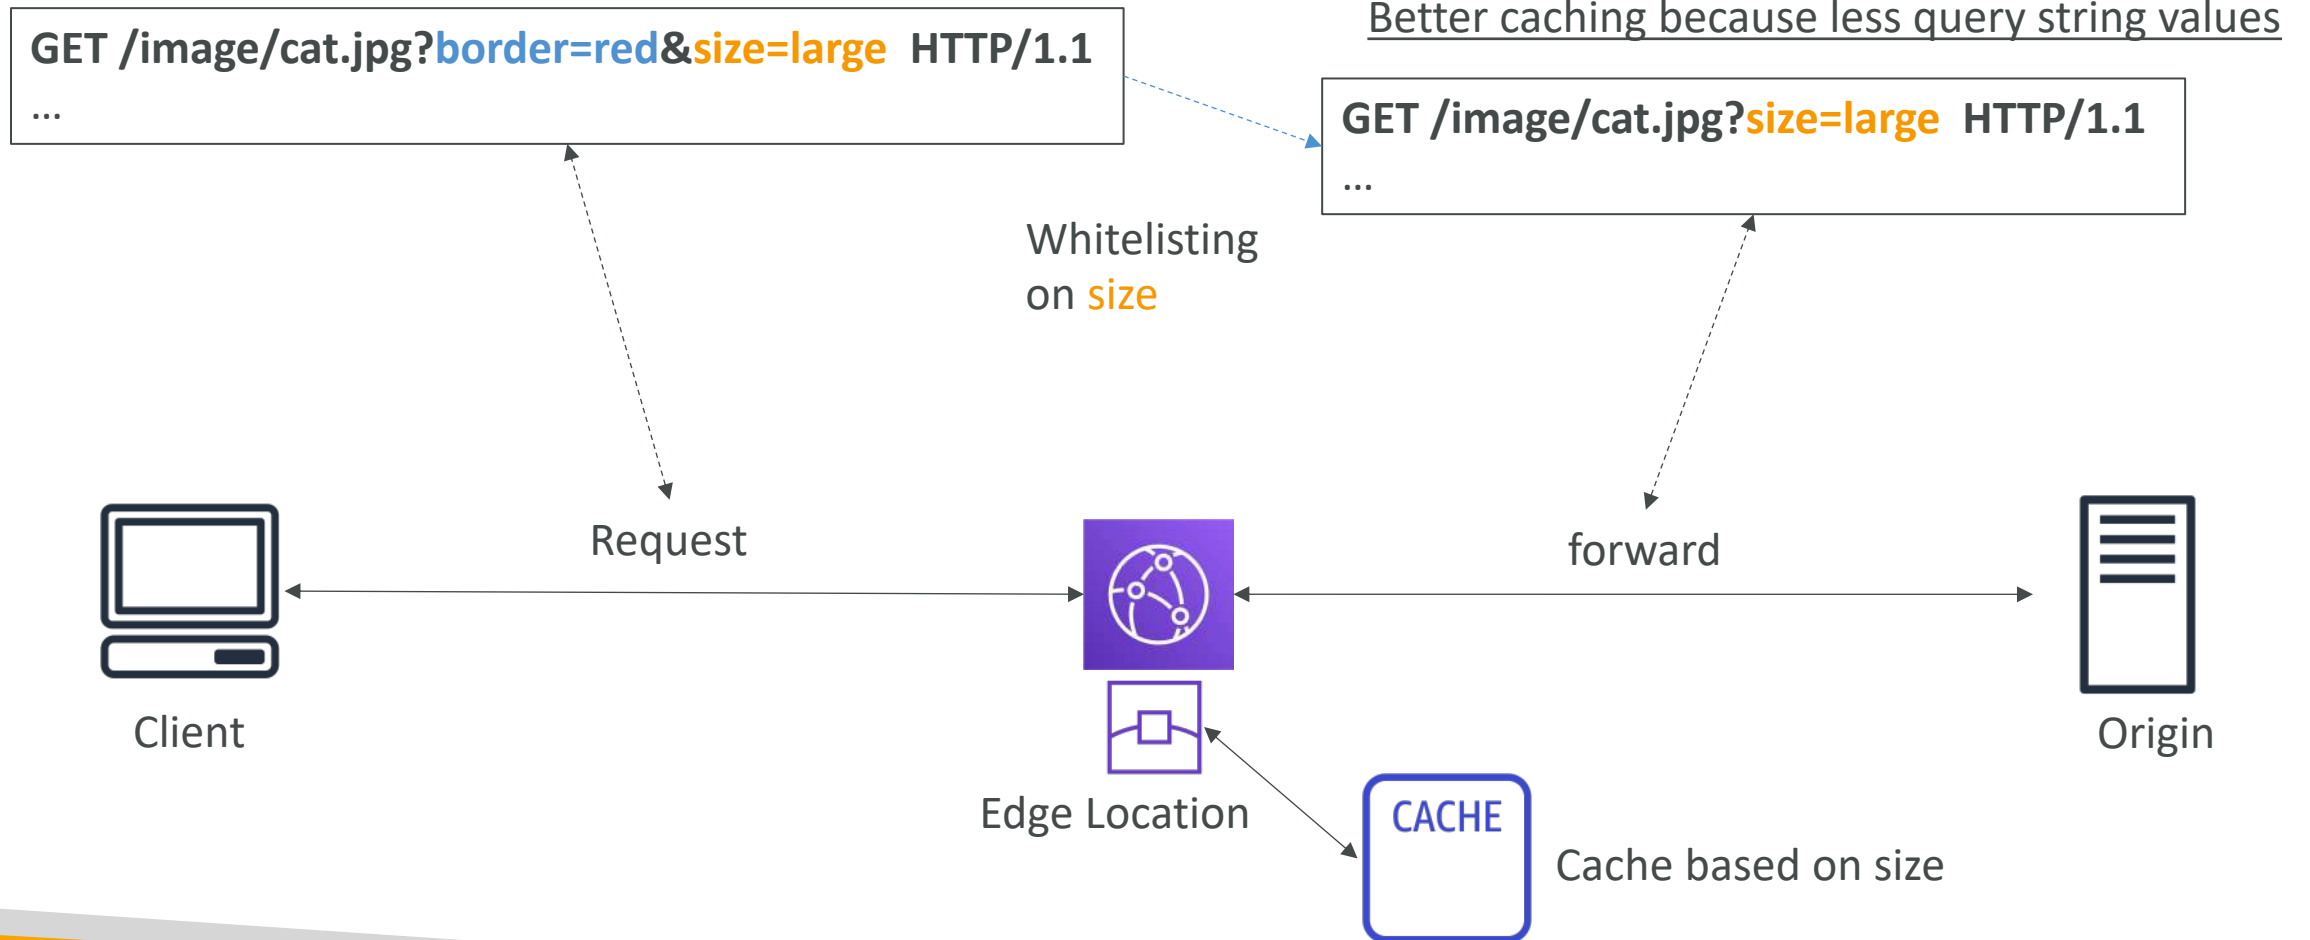

CloudFront – Maximize cache hits by separating static and dynamic distributions

CDN Layer
CloudFront

Dynamic Content (REST, HTTP server):
ALB + EC2
API Gateway + Lambda

Cache based on correct headers and cookie

Dynamic

M5

Static requests

Static content

No headers / session caching rules
Required for maximizing cache hits
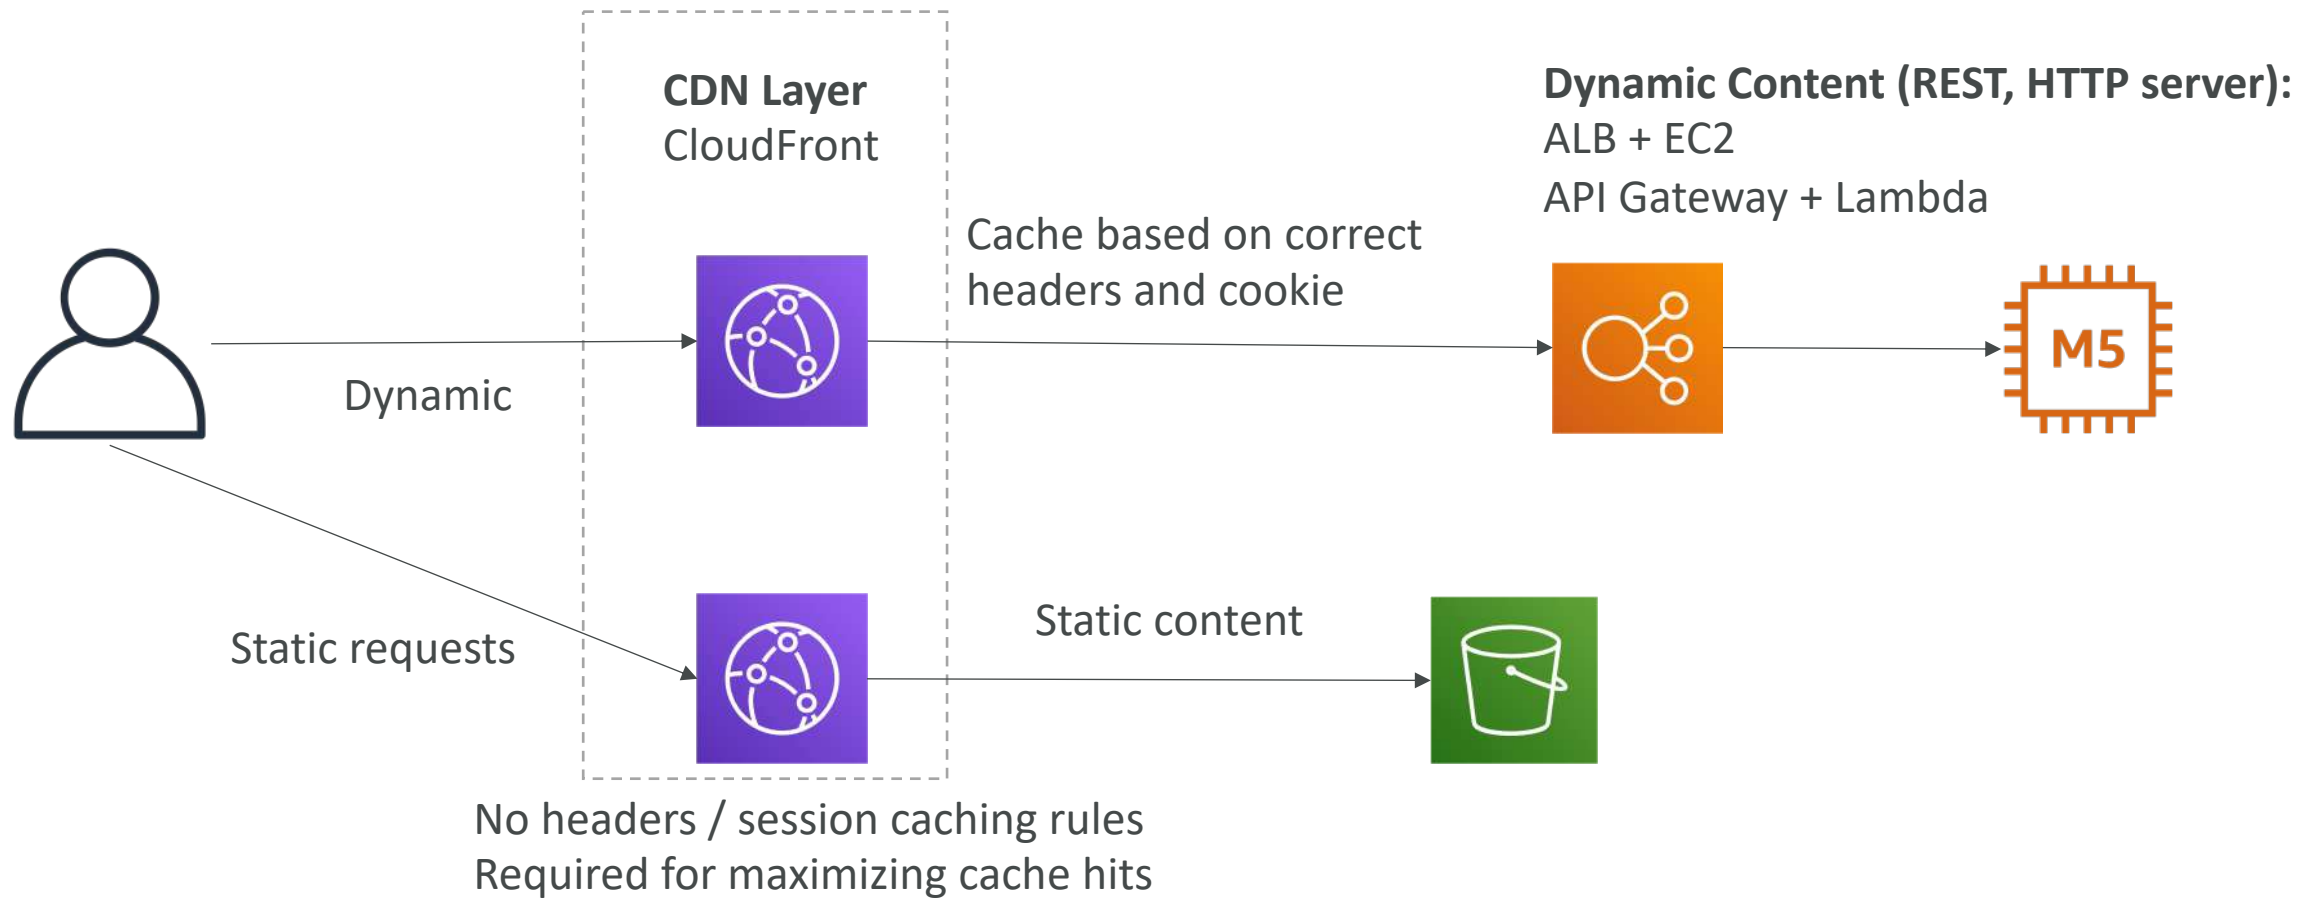

CloudFront – Increasing Cache Ratio

- Monitor the CloudWatch metric CacheHitRate

- Specify how long to cache your objects: Cache-Control max-age header
- Specify none or the minimally required **headers**
- Specify none or the minimally required **cookies**
- Specify none or the minimally required **query string parameters**
- Separate static and dynamic distributions (two origins)

CloudFront with ALB sticky sessions

- Must forward / whitelist the cookie that controls the session affinity to the origin to allow the session affinity to work
- Set a TTL to a value lesser than when the authentication cookie expires
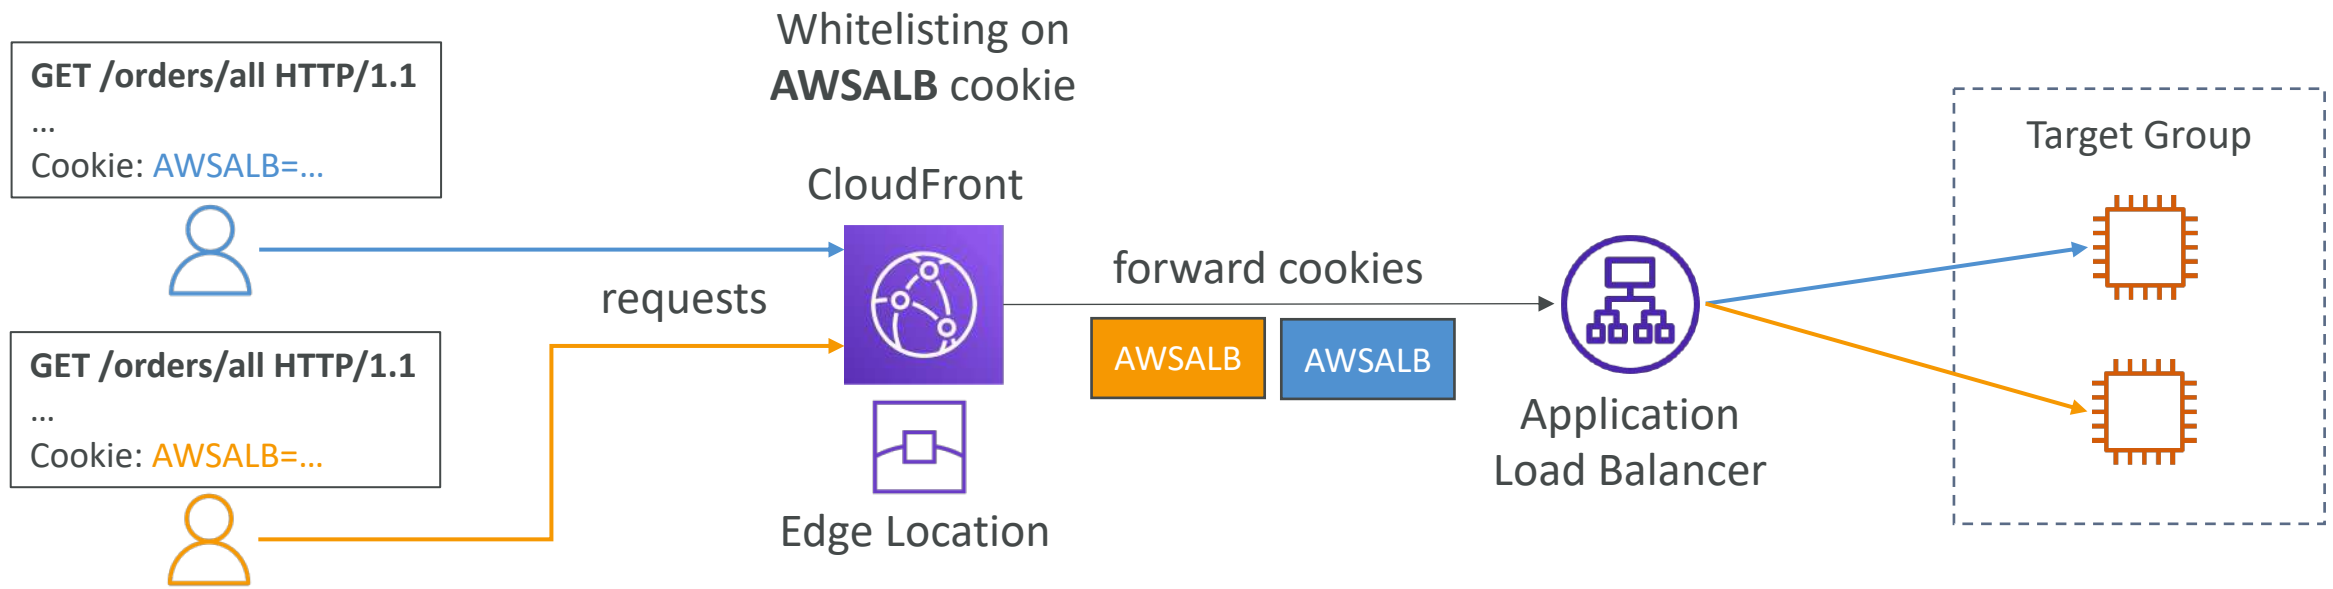

Databases in AWS

Amazon RDS Overview

- RDS stands for Relational Database Service

- It's a managed DB service for DB use SQL as a query language.

- It allows you to create databases in the cloud that are managed by AWS
  - Postgres
  - MySQL
  - MariaDB
  - Oracle
  - Microsoft SQL Server
  - IBM DB2
  - Aurora (AWS Proprietary database)

Advantage over using RDS versus deploying DB on EC2

- RDS is a managed service:
  - Automated provisioning, OS patching
  - Continuous backups and restore to specific timestamp (Point in Time Restore)!
  - Monitoring dashboards
  - Read replicas for improved read performance
  - Multi AZ setup for DR (Disaster Recovery)
  - Maintenance windows for upgrades
  - Scaling capability (vertical and horizontal)
  - Storage backed by EBS
- BUT you can't SSH into your instances

RDS – Storage Auto Scaling

- Helps you increase storage on your RDS DB instance dynamically
- When RDS detects you are running out of free database storage, it scales automatically
- Avoid manually scaling your database storage
- You have to set **Maximum Storage Threshold** (maximum limit for DB storage)
- Automatically modify storage if:
  - Free storage is less than 10% of allocated storage
  - Low-storage lasts at least 5 minutes
  - 6 hours have passed since last modification
- Useful for applications with **unpredictable workloads**
- Supports all RDS database engines

Application

Read/Write

Amazon RDS

Storage
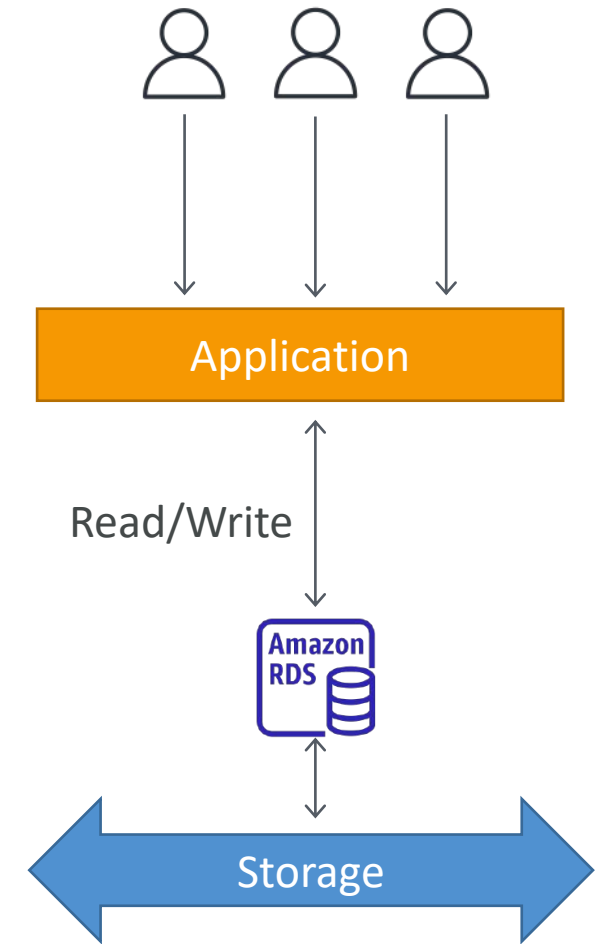

RDS Read Replicas for read scalability

- Up to 15 Read Replicas
- Within AZ, Cross AZ or Cross Region
- Replication is **ASYNC**, so reads are eventually consistent
- Replicas can be promoted to their own DB
- Applications must update the connection string to leverage read replicas

Application

reads

writes   reads

reads

ASYNC replication

ASYNC replication

RDS DB instance read replica

RDS DB instance

RDS DB instance read replica
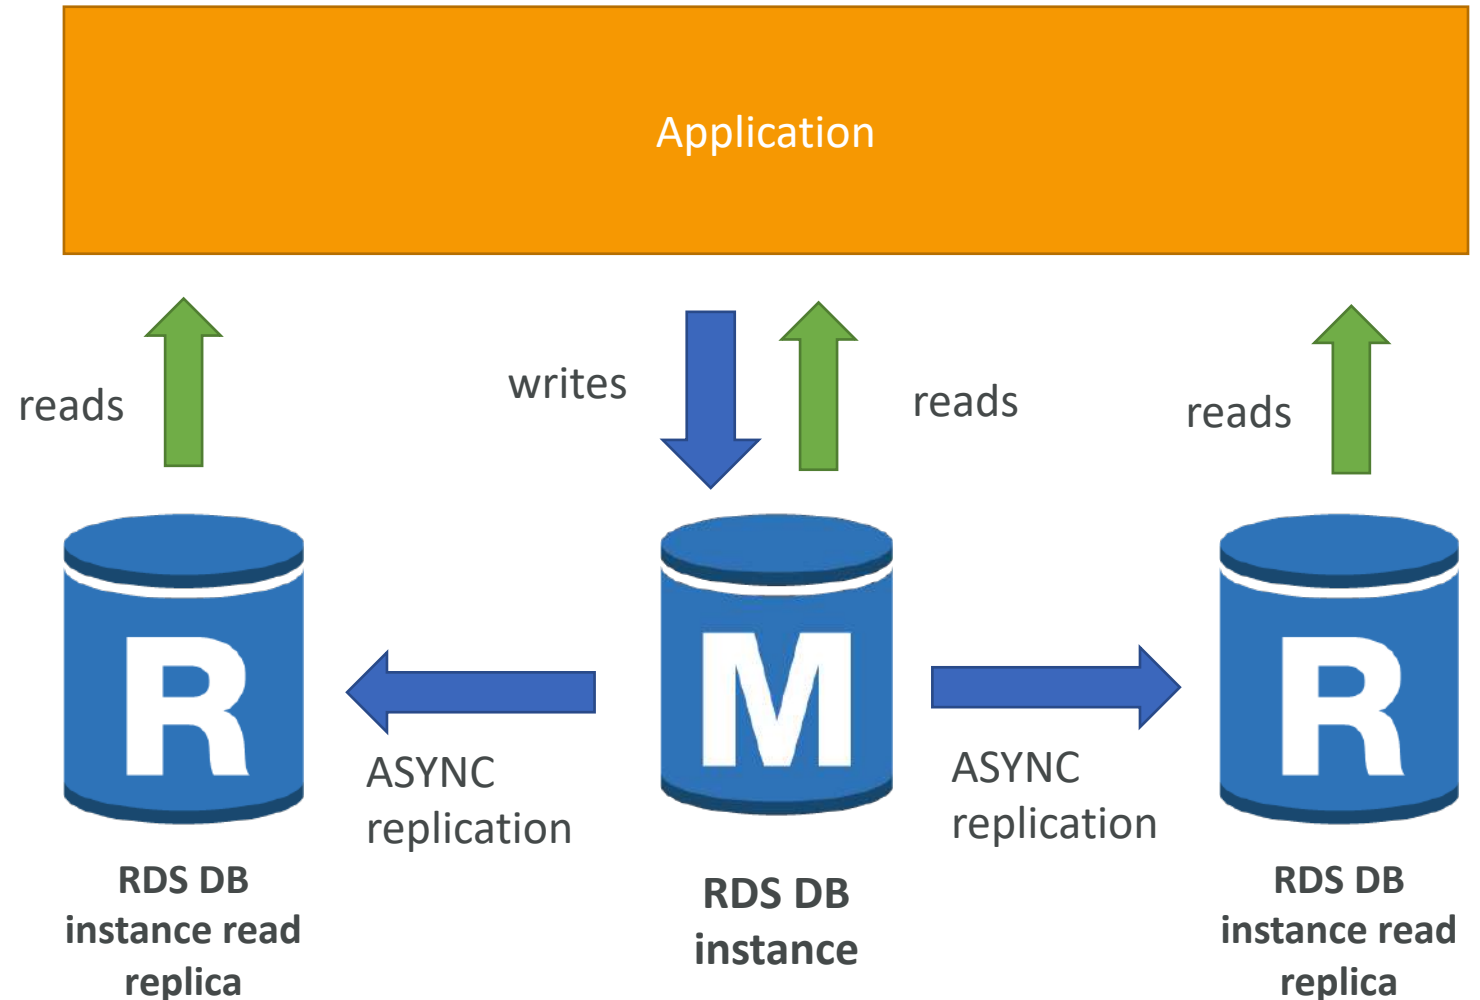

RDS Read Replicas – Use Cases

- You have a production database that is taking on normal load
- You want to run a reporting application to run some analytics
- You create a Read Replica to run the new workload there
- The production application is unaffected
- Read replicas are used for SELECT (=read) only kind of statements (not INSERT, UPDATE, DELETE)

Production Application

Reporting Application

reads

reads

M

ASYNC replication

R

RDS DB instance

RDS DB instance read replica
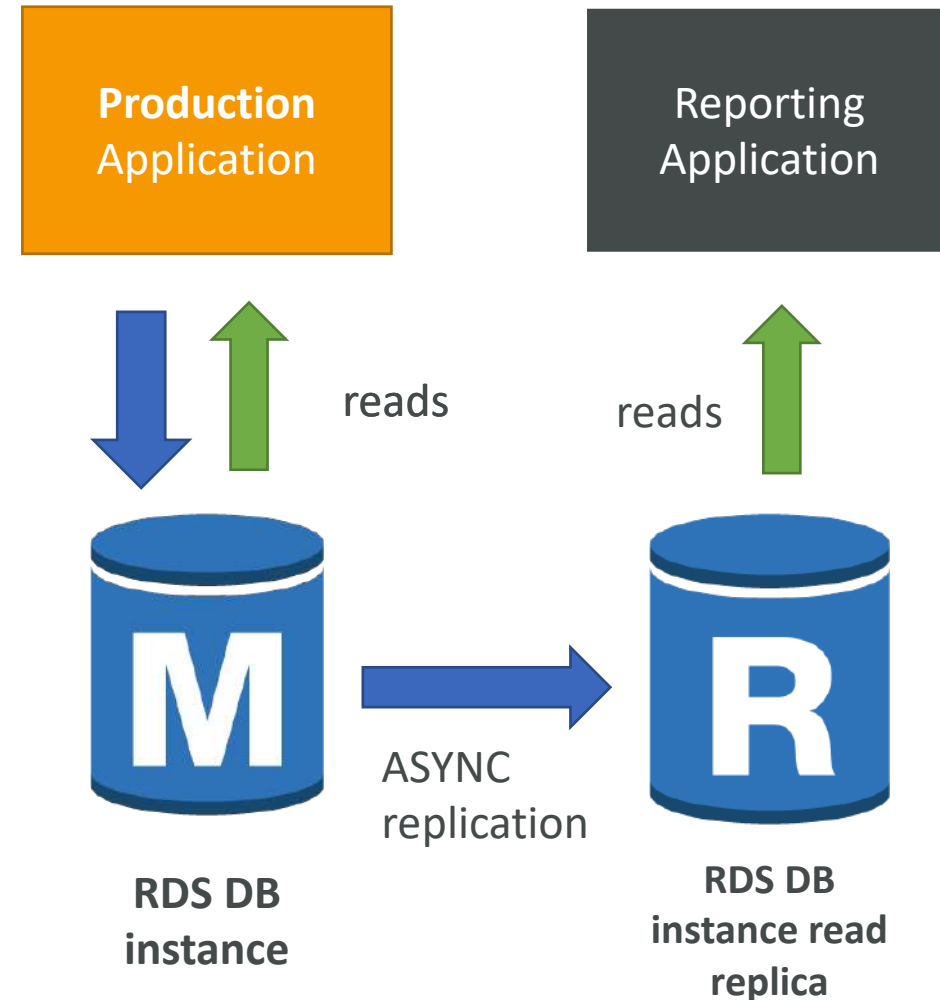

RDS Read Replicas – Network Cost

- In AWS there's a network cost when data goes from one AZ to another
- For RDS Read Replicas within the same region, you don't pay that fee
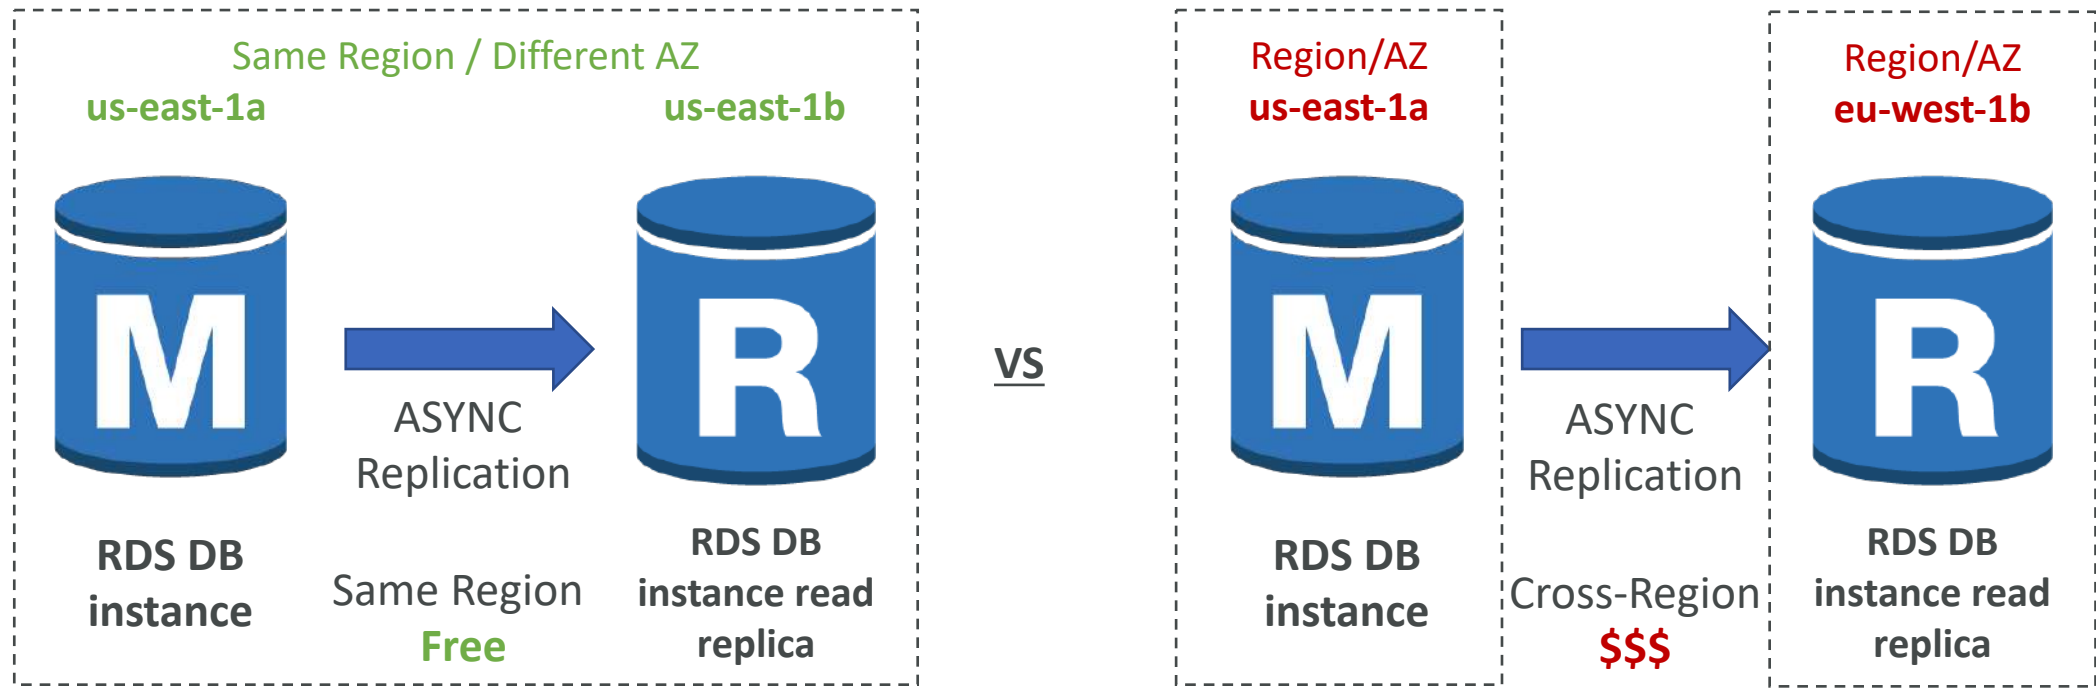

RDS Multi AZ (Disaster Recovery)

- **SYNC** replication
- One DNS name – automatic app failover to standby
- Increase **availability**
- Failover in case of loss of AZ, loss of network, instance or storage failure
- No manual intervention in apps
- Not used for scaling

- Note: The Read Replicas be setup as Multi AZ for Disaster Recovery (DR)

Application

writes   reads

One DNS name – automatic failover

S

M

SYNC replication

RDS DB instance standby (AZ B)

RDS Master DB instance (AZ A)
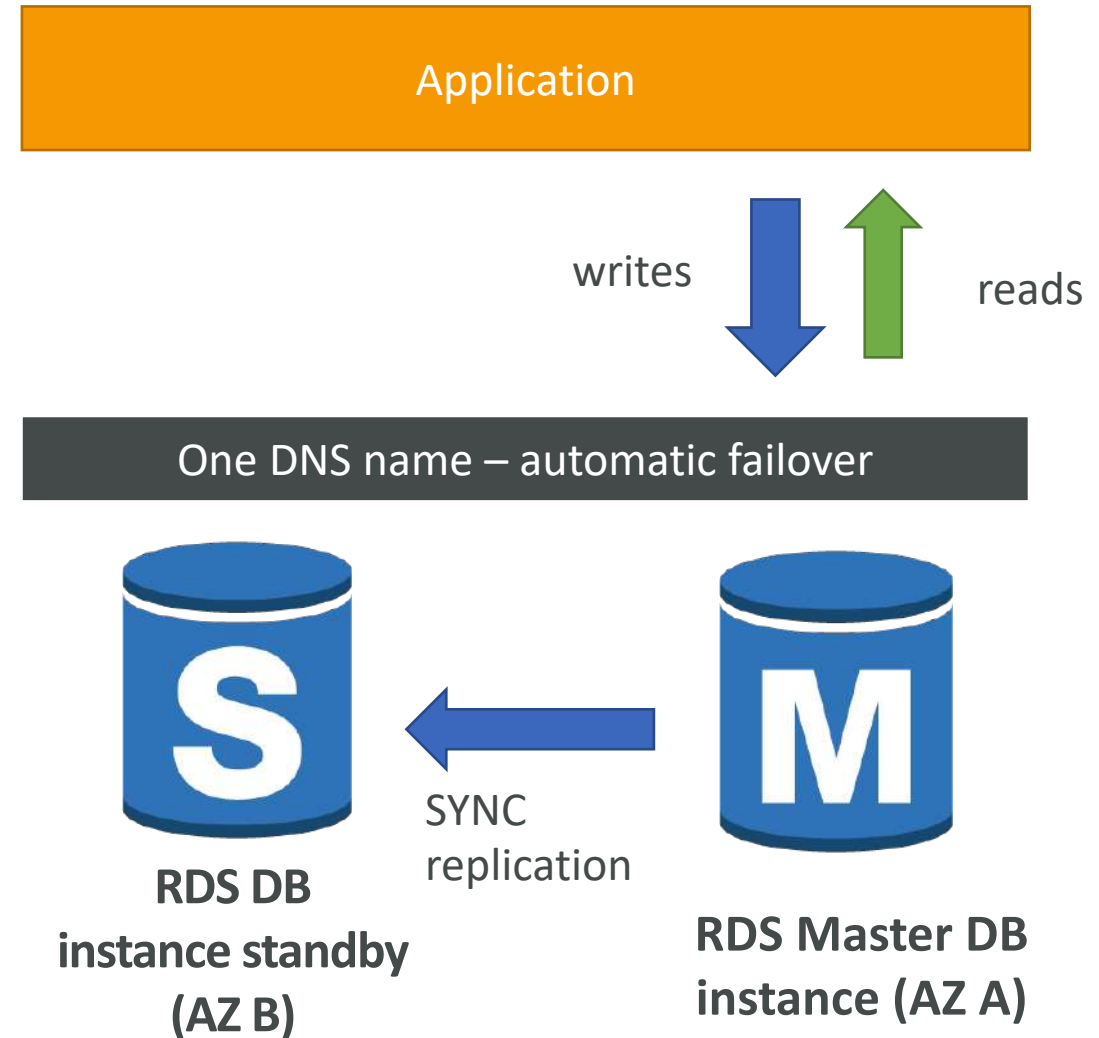

RDS – From Single-AZ to Multi-AZ

- Zero downtime operation (no need to stop the DB)
- Just click on ''modify'' for the database
- The following happens internally:
  - A snapshot is taken
  - A new DB is restored from the snapshot in a new AZ
  - Synchronization is established between the two databases

RDS DB instance

Standby DB

SYNC Replication

snapshot

restore

DB snapshot
RDS Multi AZ – Failover Conditions

- The primary DB instance
  - Failed
  - OS is undergoing software patches
  - Unreachable due to loss of network connectivity
  - Modified (e.g., DB instance type changed)
  - Busy and unresponsive
  - Underlying storage failure
- An Availability Zone outage
- A manual failover of the DB instance was initiated using **Reboot with failover**

Lambda by default

- By default, your Lambda function is launched outside your own VPC (in an AWS-owned VPC)
- Therefore, it cannot access resources in your VPC (RDS, ElastiCache, internal ELB…)

Default Lambda Deployment

AWS Cloud

Public www works

DynamoDB

VPC & Private Subnet

Not working

Private RDS
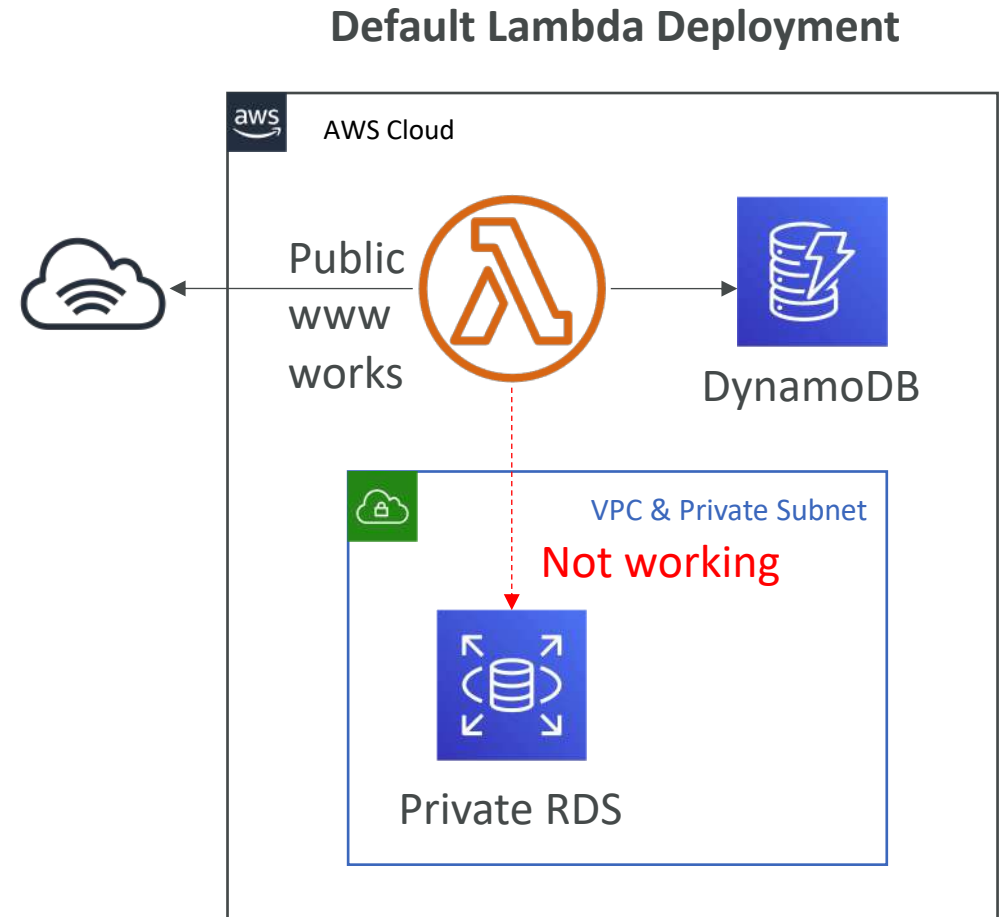

Lambda in VPC

- You must define the VPC ID, the Subnets and the Security Groups

- Lambda will create an ENI (Elastic Network Interface) in your subnets

- AWSLambdaVPCAccessExecutionRole

Lambda Function

Private subnet

Lambda Security group

Elastic Network Interface (ENI)

RDS Security group

Amazon RDS In VPC
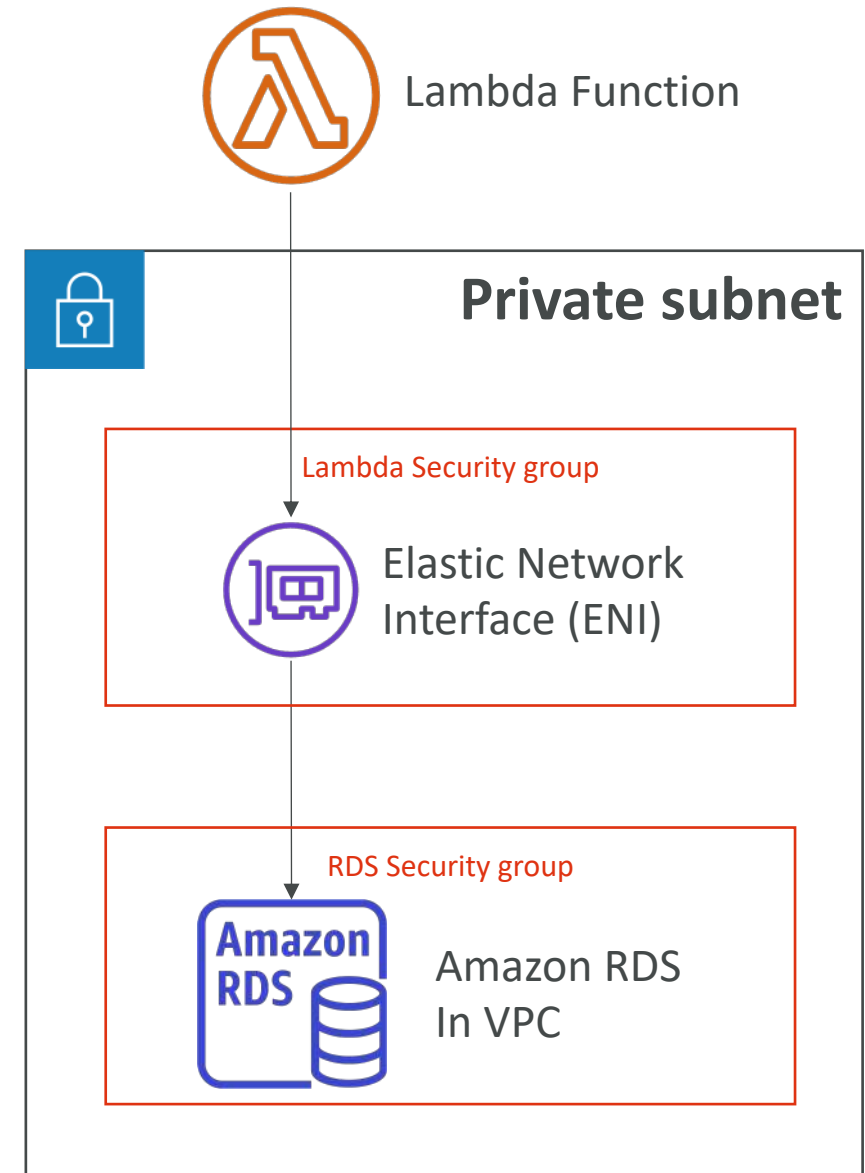

RDS Proxy for AWS Lambda

- When using Lambda functions with RDS, it opens and maintains a database connection
- This can result in a **"TooManyConnections"** exception
- With RDS Proxy, you no longer need code that handles cleaning up idle connections and managing connection pools
- Supports IAM authentication or DB authentication, auto-scaling
- The Lambda function must have connectivity to the Proxy (public proxy => public Lambda, private proxy => Lambda in VPC)

Lambda functions

IAM Authentication

VPC

Public subnet

RDS Proxy

Private subnet

RDS DB Instance
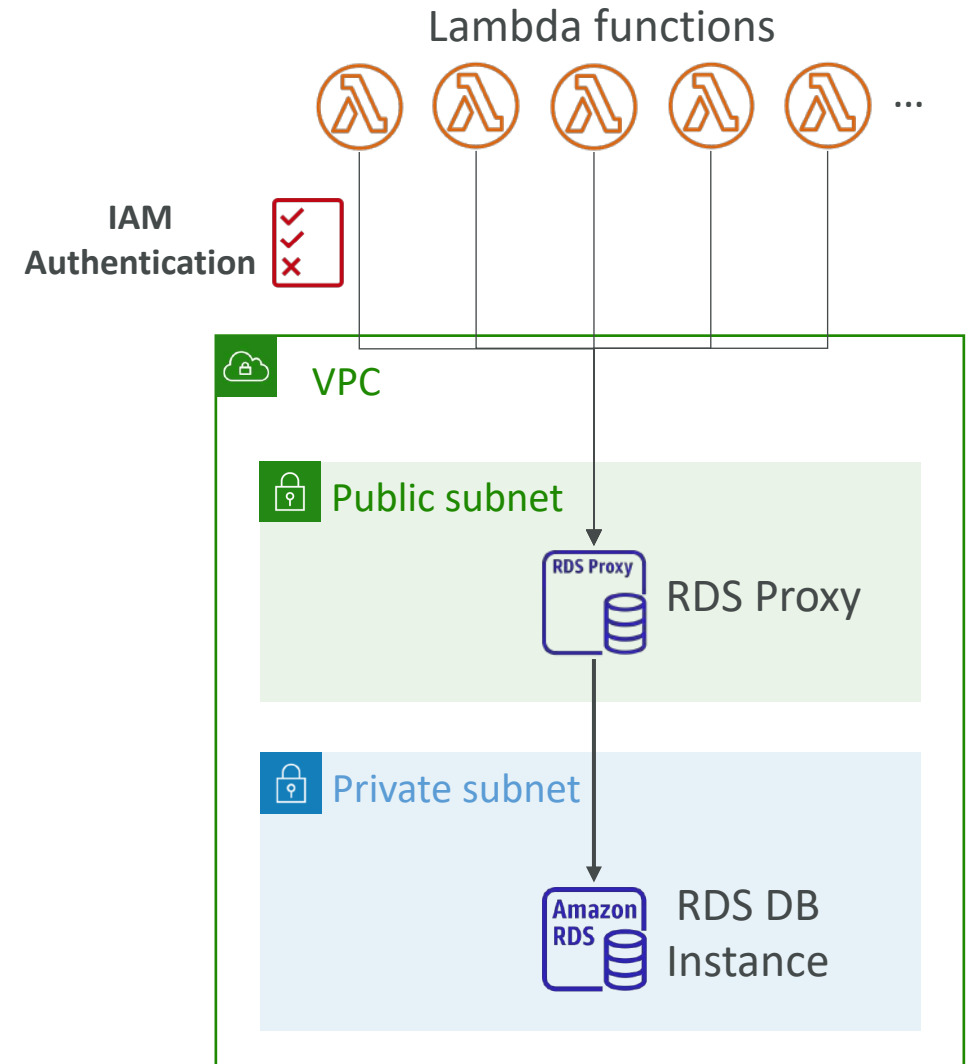

DB Parameter Groups

- You can configure the DB engine using Parameter Groups

- Dynamic parameters are applied immediately

- Static parameters are applied after instance reboot

- You can modify parameter group associated with a DB (must reboot)

- See documentation for list of parameters for a DB technology

- **Must-know parameter:**
  - PostgreSQL / SQL Server: **rds.force_ssl=1** => force SSL connections
  - MySQL / MariaDB: **require_secure_transport=1** => force SSL connections

RDS Backup vs. Snapshots

Backups

- Backups are "continuous" and allow point in time recovery

- Backups happen during maintenance windows

- When you delete a DB instance, you can retain automated backups

- Backups have a retention period you set between 0 and 35 days

- To disable backups, set retention period to 0

Snapshots

- Snapshots takes IO operations and can stop the database from seconds to minutes

- Snapshots taken on Multi AZ DB don't impact the master – just the standby

- Snapshots are incremental after the first snapshot (which is full)

- You can copy & share DB Snapshots

- **Manual** Snapshots don't expire

- You can take a "final snapshot" when you delete your DB

Restoring from Automated Backups or DB Snapshots creates a new DB Instance

RDS Snapshots Sharing

- **Manual snapshots:** can be shared with AWS accounts
- **Automated snapshots:** can't be shared, copy first
- You can only share unencrypted snapshots and snapshots encrypted with a customer managed key
- If you share an encrypted snapshots, you must also share any customer managed keys used to encrypt them

RDS Events & Event Subscriptions

- RDS keeps record of events related to:
  - DB instances
  - Snapshots
  - Parameter groups, security groups …
- Example: DB state changed from pending to running
- **RDS Event Subscriptions**
  - Subscribe to events to be notified when an event occurs using SNS
  - Specify the Event Source (instances, SGs, …) and the Event Category (creation, failover, …)
- RDS delivers events to EventBridge

DB Instance **(backup event)**

DB Admin
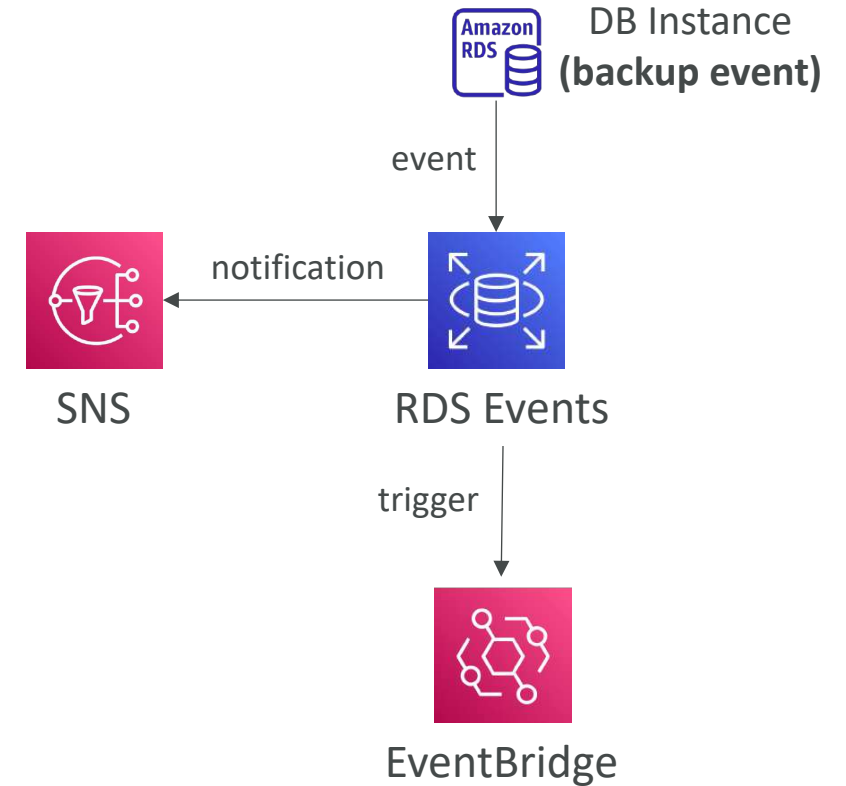

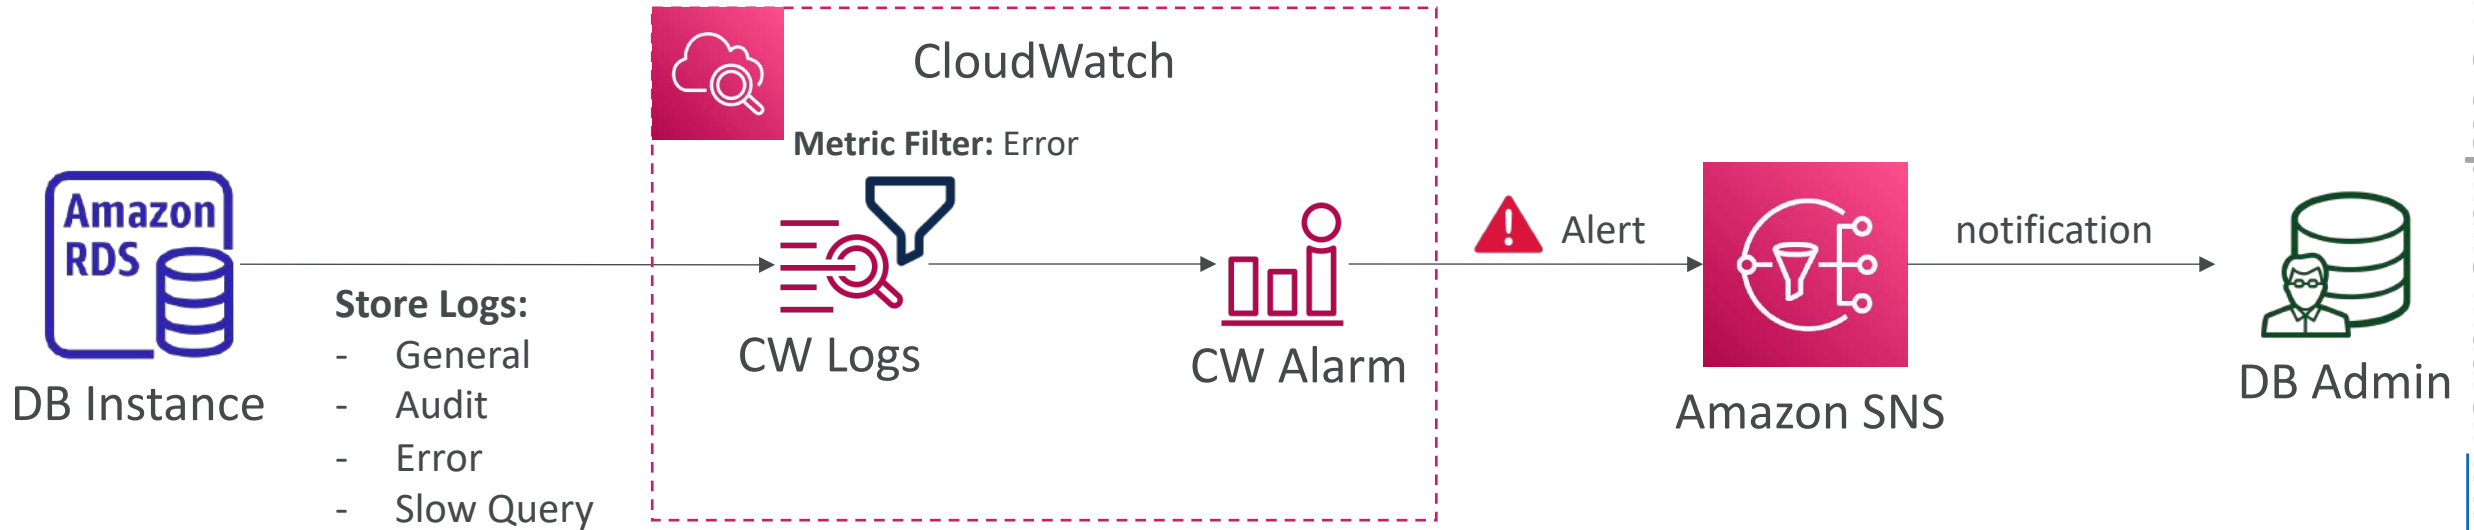

RDS with CloudWatch

- CloudWatch metrics associated with RDS (gathered from the hypervisor):
  - DatabaseConnections
  - SwapUsage
  - ReadIOPS / WriteIOPS
  - ReadLatency / WriteLatency
  - ReadThroughPut / WriteThroughPut
  - DiskQueueDepth
  - FreeStorageSpace

- Enhanced Monitoring (gathered from an agent on the DB instance)
  - Useful when you need to see how different processes or threads use the CPU
  - Access to over 50 new CPU, memory, file system, and disk I/O metrics

RDS Performance Insights

- Visualize your database performance and analyze any issues that affect it
- With the Performance Insights dashboard, you can visualize the database load and filter the load:
  - By Waits => find the resource that is the bottleneck (CPU, IO, lock, etc…)
  - By SQL statements => find the SQL statement that is the problem
  - By Hosts => find the server that is using the most our DB
  - By Users => find the user that is using the most our DB
- DBLoad = the number of active sessions for the DB engine
- You can view the SQL queries that are putting load on your database

Performance Insights Screenshots

Amazon Aurora

- Aurora is a proprietary technology from AWS (not open sourced)

- Postgres and MySQL are both supported as Aurora DB (that means your drivers will work as if Aurora was a Postgres or MySQL database)

- Aurora is "AWS cloud optimized" and claims 5x performance improvement over MySQL on RDS, over 3x the performance of Postgres on RDS

- Aurora storage automatically grows in increments of 10GB, up to 128 TB.

- Aurora can have up to 15 replicas and the replication process is faster than MySQL (sub 10 ms replica lag)

- Failover in Aurora is instantaneous. It's HA (High Availability) native.

- Aurora costs more than RDS (20% more) – but is more efficient

Aurora High Availability and Read Scaling

- 6 copies of your data across 3 AZ:
    - 4 copies out of 6 needed for writes
    - 3 copies out of 6 need for reads
    - Self healing with peer-to-peer replication
    - Storage is striped across 100s of volumes
- One Aurora Instance takes writes (master)
- Automated failover for master in less than 30 seconds
- Master + up to 15 Aurora Read Replicas serve reads
- **Support for Cross Region Replication**
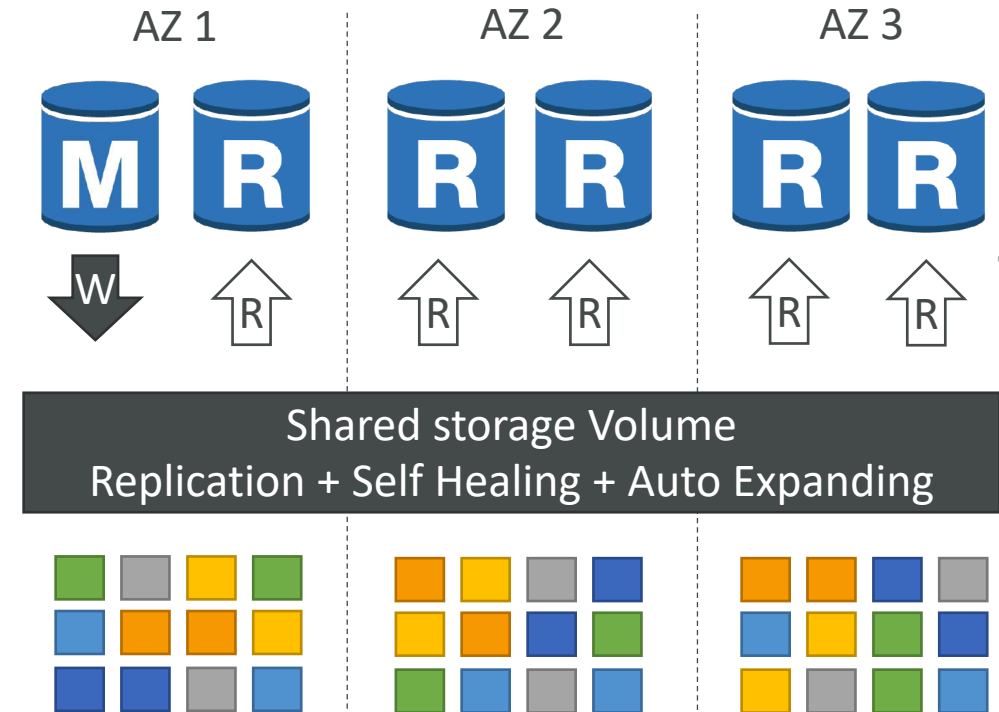

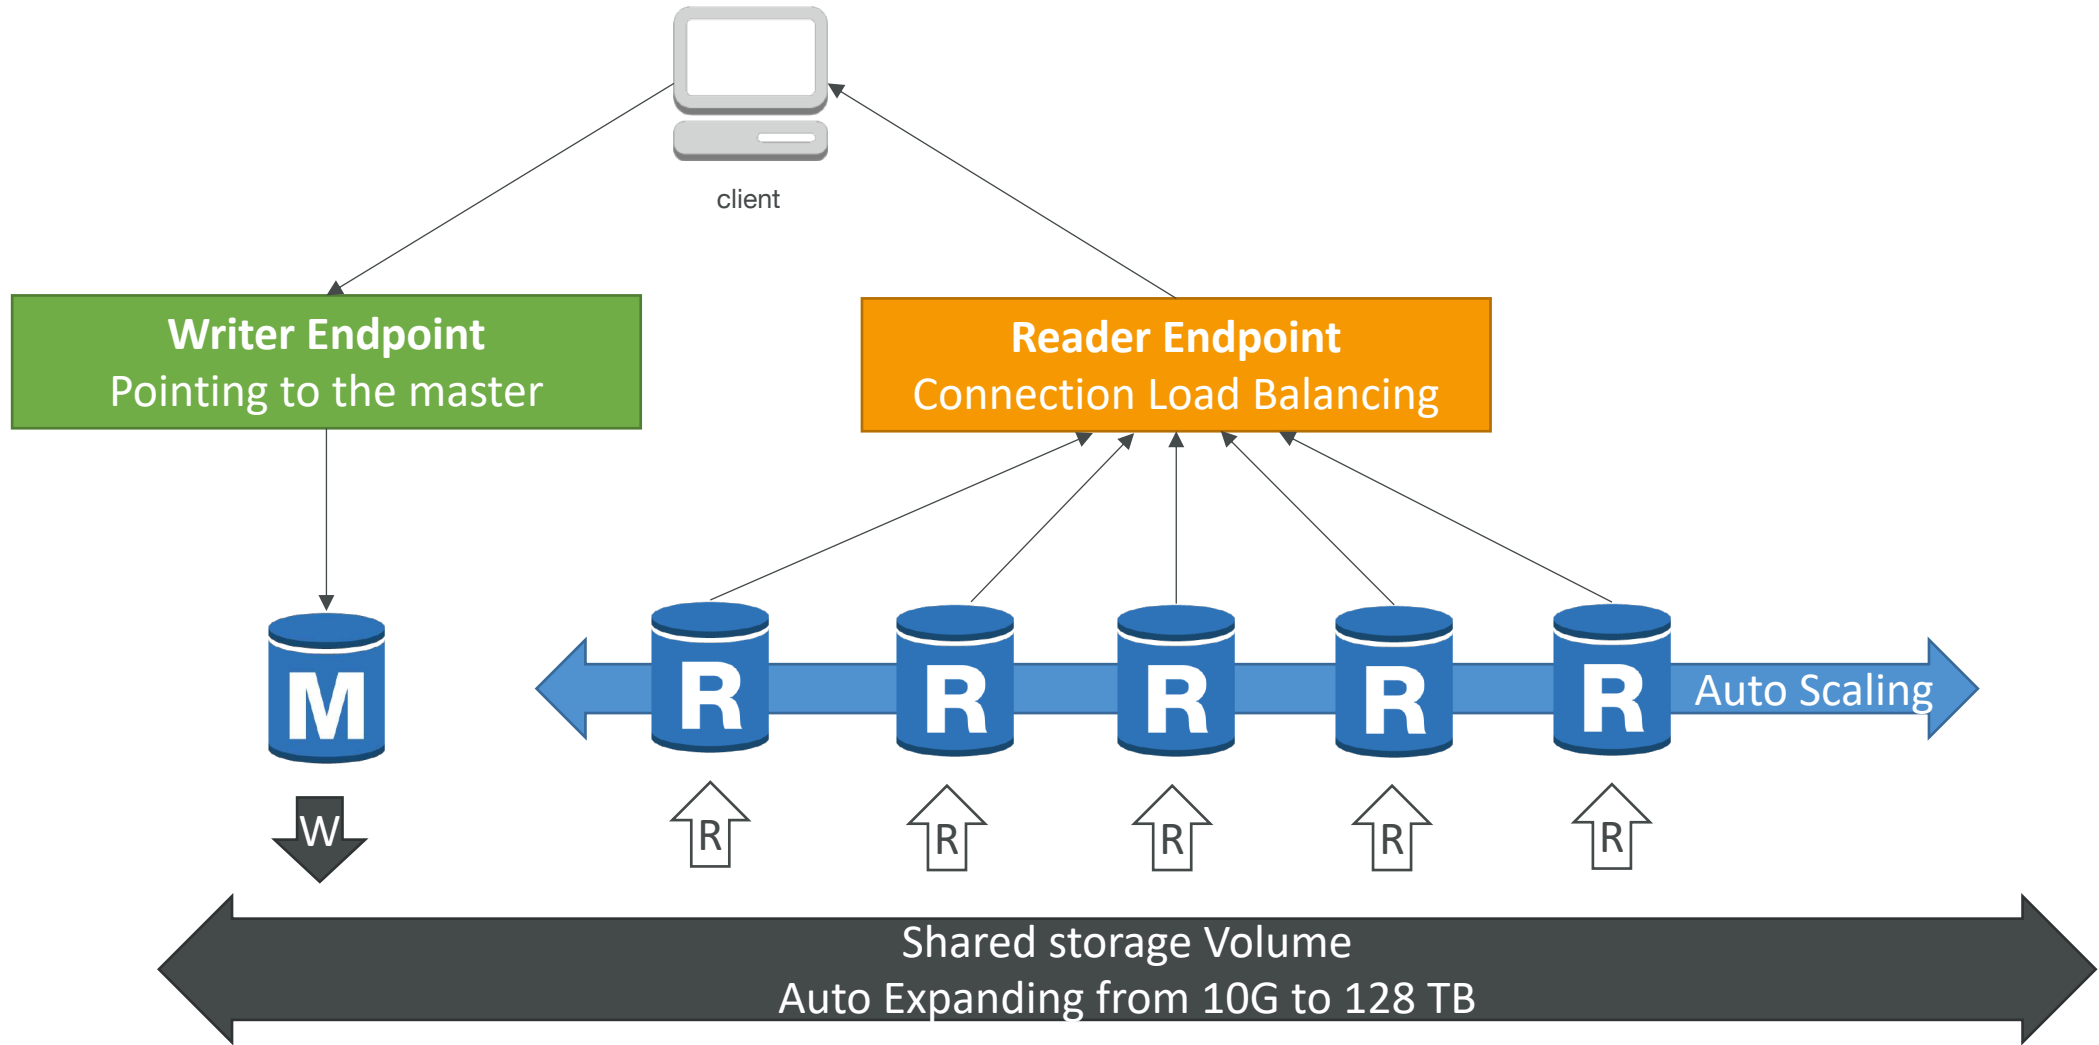

Features of Aurora

- Automatic fail-over
- Backup and Recovery
- Isolation and security
- Industry compliance
- Push-button scaling
- Automated Patching with Zero Downtime
- Advanced Monitoring
- Routine Maintenance
- Backtrack: restore data at any point of time without using backups

Backups, Backtracking & Restores in Aurora

- Automatic Backups
  - Retention period 1-35 days (can't be disabled)
  - PITR, restore your DB cluster within 5 minutes of the current time
  - Restore to a new DB cluster
- Aurora Backtracking
  - Rewind the DB cluster back and forth in time (up to 72 hours)
  - Doesn't create a new DB cluster (in-place restore)
  - Supports Aurora MySQL only
- Aurora Database Cloning
  - Creates a new DB cluster that uses the same DB cluster volume as the original cluster
  - Uses *copy-on-write* protocol (use the original/single copy of the data and allocate storage only when changes made to the data)
  - Example: create a test environment using your production data

Aurora for SysOps

- You can associate a priority tier (0-15) on each Read Replica
    - Controls the failover priority
    - RDS will promote the Read Replica with the highest priority (lowest tier)
    - If replicas have the same priority, RDS promotes the largest in size
    - If replicas have the same priority and size, RDS promotes arbitrary replica

- You can migrate an RDS MySQL snapshot to Aurora MySQL Cluster

Aurora: CloudWatch metrics

- **AuroraReplicaLag:** amount of lag when replicating updates from the primary instance
- **AuroraReplicaLagMaximum:** max. amount of lag across all DB instances in the cluster
- **AuroraReplicaLagMinimum:** min. amount of lag across all DB instances in the cluster
- If replica lag is high, that means the users will have a different experience based on which replica they get the data from (eventual consistency)
- **DatabaseConnections:** current number of connections to a DB instance
- **InsertLatency:** average duration of insert operations

High Replica Lag

Replication

RDS & Aurora Security

- At-rest encryption:
  - Database master & replicas encryption using AWS KMS – must be defined as launch time
  - If the master is not encrypted, the read replicas cannot be encrypted
  - To encrypt an un-encrypted database, go through a DB snapshot & restore as encrypted

- In-flight encryption: TLS-ready by default, use the AWS TLS root certificates client-side

- IAM Authentication: IAM roles to connect to your database (instead of username/pw)

- Security Groups: Control Network access to your RDS / Aurora DB

- No SSH available except on RDS Custom

- Audit Logs can be enabled and sent to CloudWatch Logs for longer retention

Amazon ElastiCache Overview

- The same way RDS is to get managed Relational Databases…
- ElastiCache is to get managed Redis or Memcached
- Caches are in-memory databases with really high performance, low latency
- Helps reduce load off of databases for read intensive workloads
- Helps make your application stateless
- AWS takes care of OS maintenance / patching, optimizations, setup, configuration, monitoring, failure recovery and backups
- <u>Using ElastiCache involves heavy application code changes</u>

ElastiCache
Solution Architecture - DB Cache

- Applications queries ElastiCache, if not available, get from RDS and store in ElastiCache.

- Helps relieve load in RDS

- Cache must have an invalidation strategy to make sure only the most current data is used in there.

application

Amazon ElastiCache

Cache hit

Cache miss

Read from DB

Write to cache

Amazon RDS
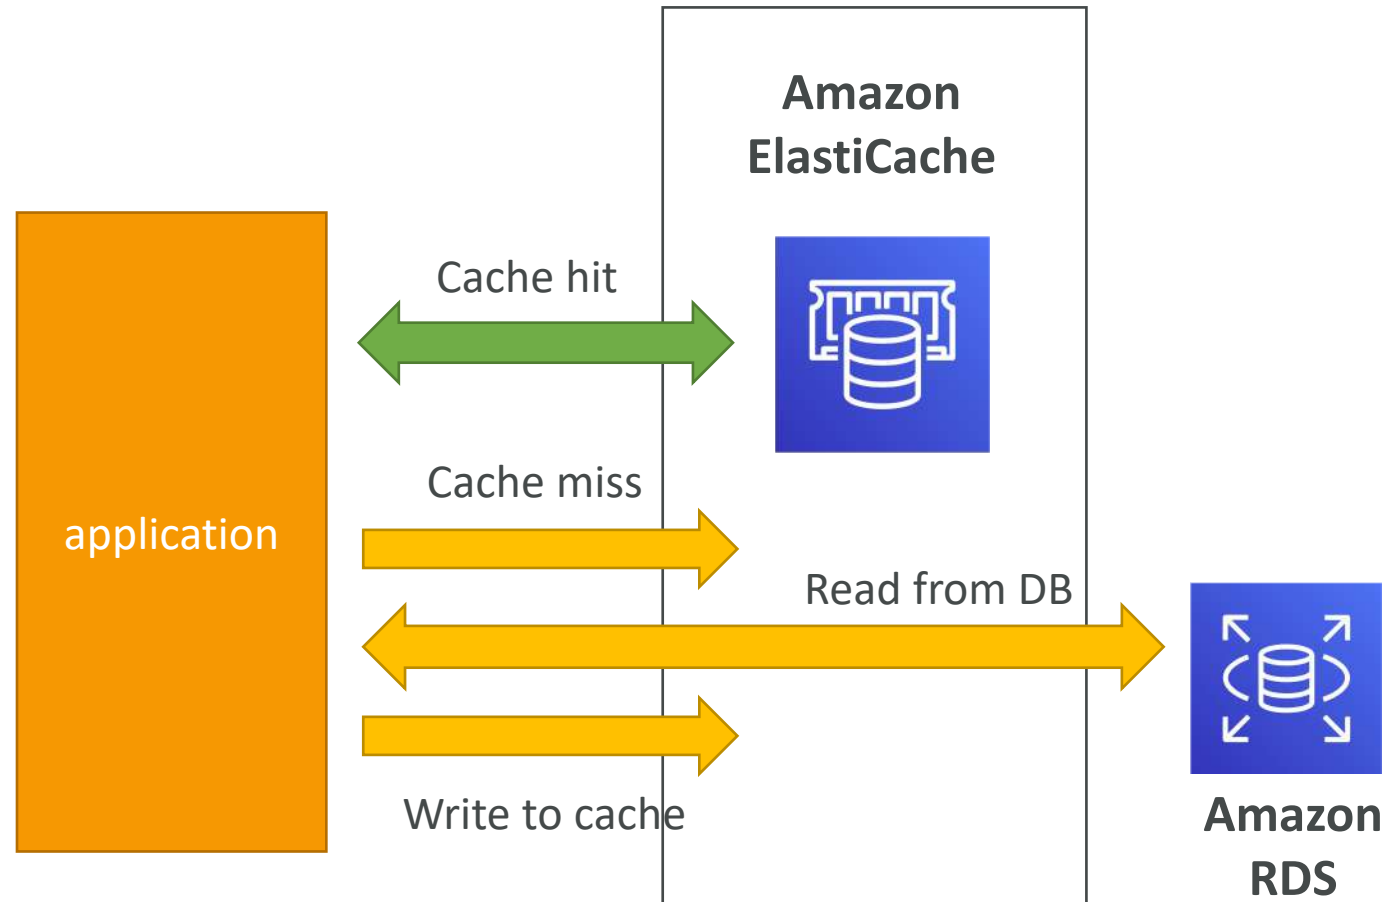

ElastiCache
Solution Architecture – User Session Store

- User logs into any of the application
- The application writes the session data into ElastiCache
- The user hits another instance of our application
- The instance retrieves the data and the user is already logged in

Amazon ElastiCache
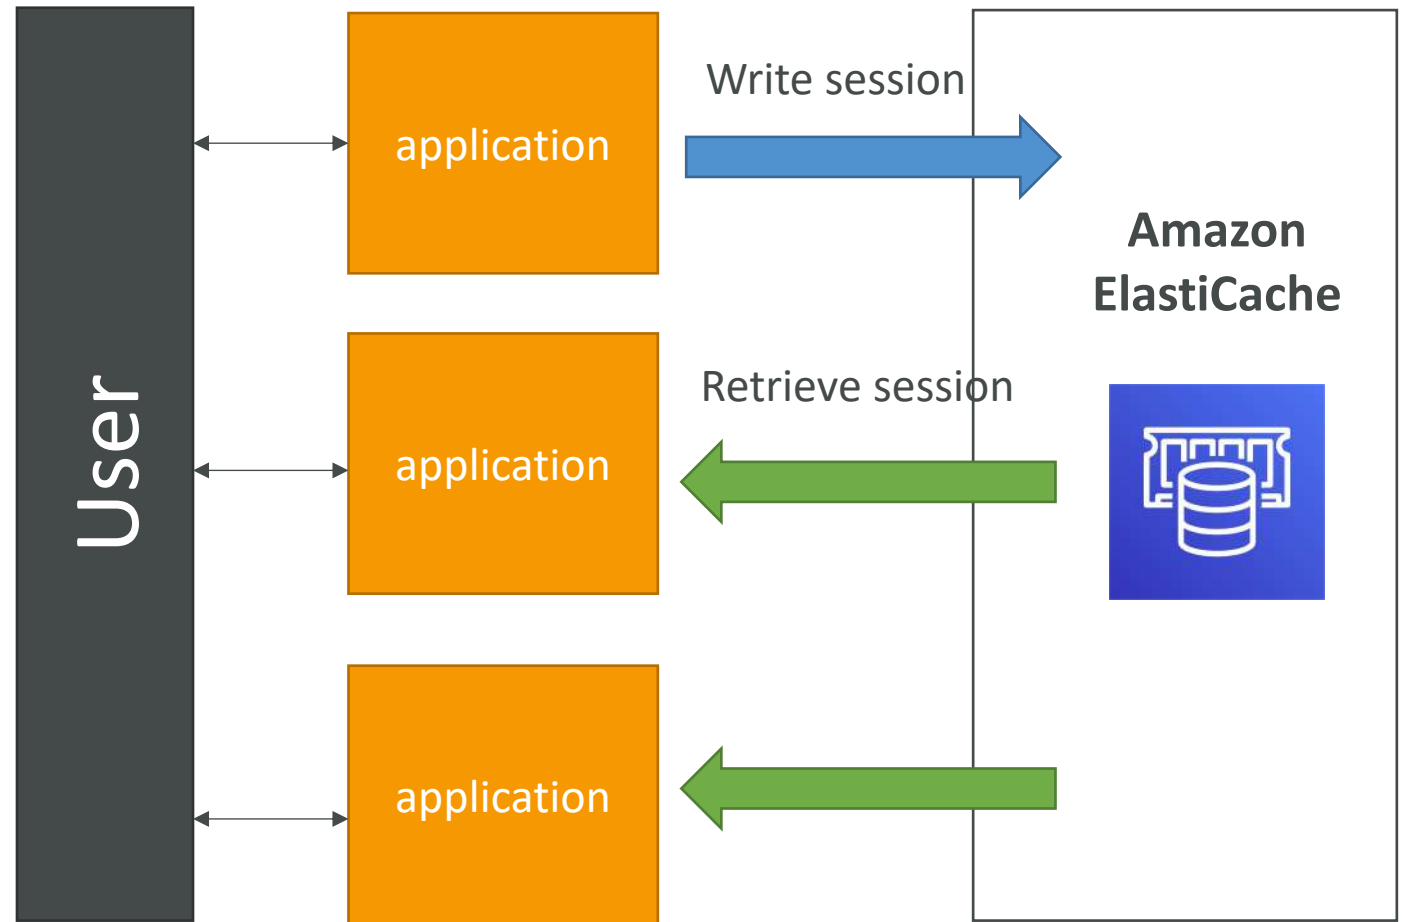

ElastiCache – Redis vs Memcached

REDIS

- **Multi AZ** with Auto-Failover
- **Read Replicas** to scale reads and have **high availability**
- Data Durability using AOF persistence
- **Backup and restore features**
- Supports Sets and Sorted Sets

MEMCACHED

- Multi-node for partitioning of data (sharding)
- **No high availability (replication)**
- **Non persistent**
- Backup and restore (Serverless)
- Multi-threaded architecture

Replication

+ sharding
ElastiCache Replication: Cluster Mode Disabled

- One primary node, up to 5 replicas

- Asynchronous Replication

- The primary node is used for read/write

- The other nodes are read-only

- **One shard, all nodes have all the data**

- Guard against data loss if node failure

- Multi-AZ enabled by default for failover

- Helpful to scale read performance

Redis (cluster mode disabled) Cluster with Replication
Shard

CACHE

0-5 Replica Nodes

Redis Scaling – Cluster Mode Disabled

- Horizontal:
    - Scale out/in by adding/removing read replicas (max. 5 replicas)

- Vertical:
    - Scale up/down to larger/smaller node type
    - ElastiCache will internally create a new node group, then data replication and DNS update

ElastiCache Replication: Cluster Mode Enabled

- **Data is partitioned across shards (helpful to scale writes)**

- Each shard has a primary and up to 5 replica nodes (same concept as before)

- Multi-AZ capability

- Up to 500 nodes per cluster:
  - 500 shards with single master
  - 250 shards with 1 master and 1 replica
  - …
  - 83 shards with one master and 5 replicas

ElastiCache for Redis – Auto Scaling

- Automatically increase/decrease the desired shards or replicas
- Supports both **Target Tracking and Scheduled** Scaling Policies
- Works only for Redis with **Cluster Mode Enabled**

© Stephane Maarek
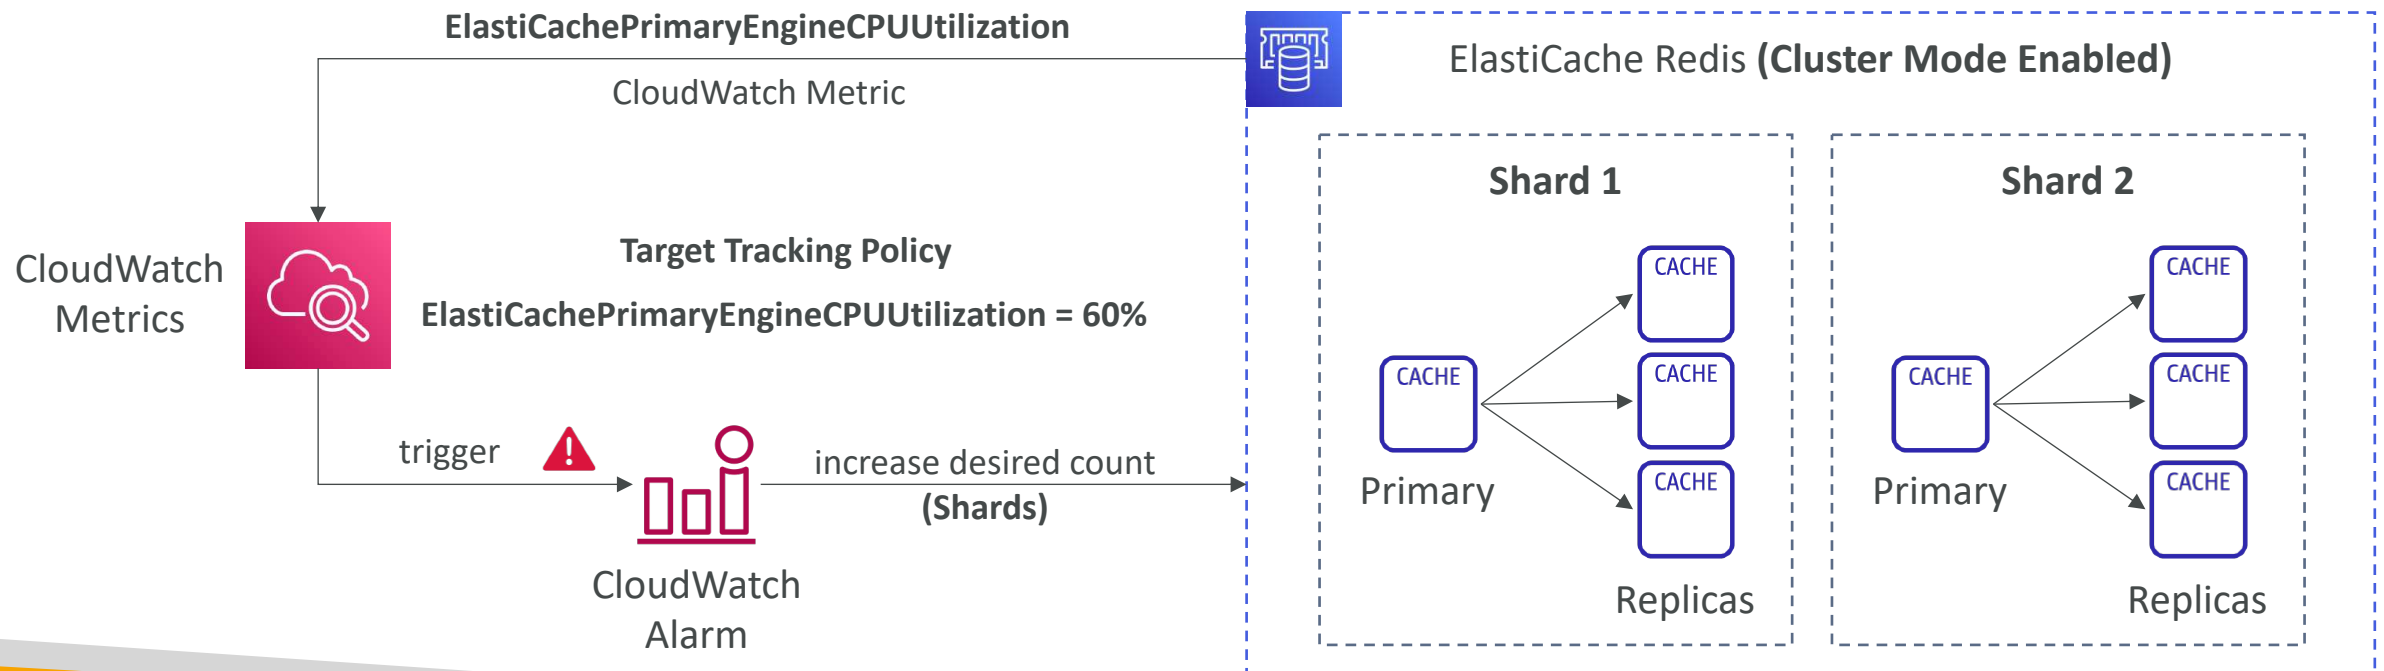

ElastiCache – Redis Connection Endpoints

- **Standalone Node**
  - One endpoint for read and write operations

- **Cluster Mode Disabled Cluster**
  - Primary Endpoint – for all write operations
  - Reader Endpoint – evenly split read operations across all read replicas
  - Node Endpoint – for read operations

- **Cluster Mode Enabled Cluster**
  - Configuration Endpoint – for all read/write operations that support Cluster Mode Enabled commands
  - Node Endpoint – for read operations
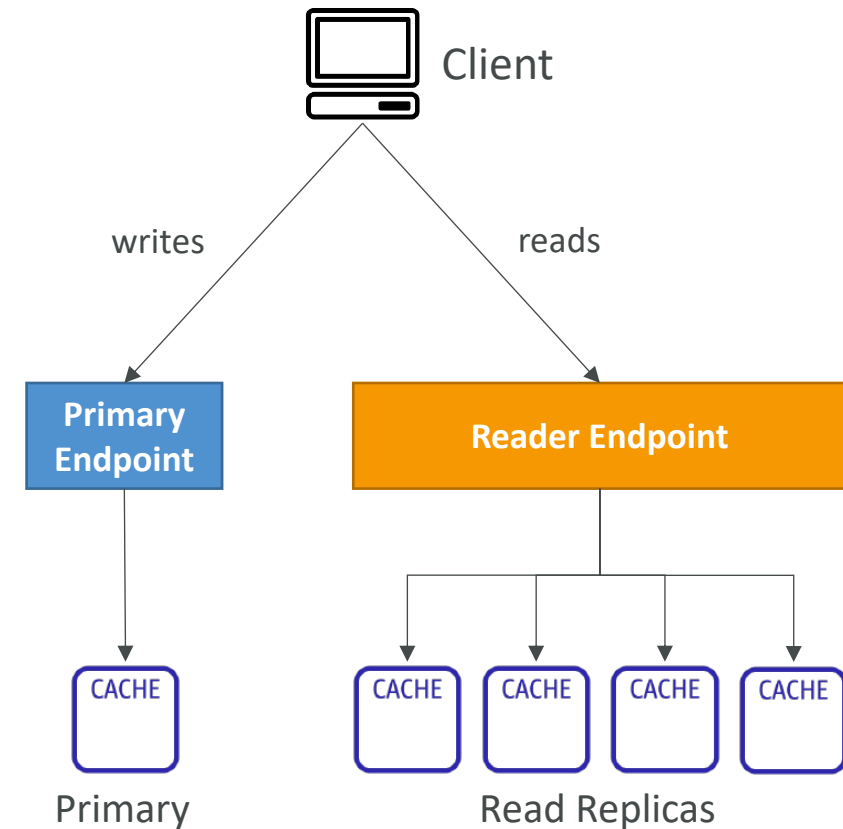

Client

Redis Scaling – Cluster Mode Disabled

- Horizontal:
  - Scale out/in by adding/removing read replicas (max. 5 replicas)
- Vertical:
  - Scale up/down to larger/smaller node type
  - ElastiCache will internally create a new node group, then data replication and DNS update
Redis Scaling – Cluster Mode Enabled

- Two Modes:
  - **Online Scaling:** continue serving requests during the scaling process (no downtime, some degradation in performance)
  - **Offline Scaling:** unable to serve requests during the scaling process (backup and restore). Additional configurations supported (change node type, upgrade engine version, …)
- **Horizontal:** (Resharding and Shard Rebalancing)
  - **Resharding:** scale out/in by adding/removing shards
  - **Shard Rebalancing:** equally distribute the keyspaces among the shards as possible
  - Supports Online and Offline Scaling
- **Vertical:** (change read/write capacity)
  - Scale up/down to larger/smaller node type
  - Supports Online Scaling

Redis Metrics to Monitor

- **Evictions:** the number of non-expired items the cache evicted to allow space for new writes (memory is overfilled). Solution:
  - Choose an eviction policy to evict expired items (e.g., evict least recently used (LRU) items)
  - Scale up to larger node type (more memory) or scale out by adding more nodes
- **CPUUtilization:** monitor CPU utilization for the entire host
  - Solution: scale up to larger node type (more memory) or scale out by adding more nodes
- **SwapUsage:** should not exceed 50 MB
  - Solution: verify that you have configured enough reserved memory

Redis Metrics to Monitor

- **CurrConnections:** the number of concurrent and active connections
  - Solution: investigate application behavior to address the issue
- **DatabaseMemoryUsagePercentage:** the percentage of memory utilization
- **NetworkBytesIn/Out & NetworkPacketsIn/Out**
- **ReplicationBytes:** the volume of data being replicated
- **ReplicationLag:** how far behind the replica is from the primary node

Memcached Scaling

- Memcached Clusters can have 1-40 nodes (soft limit)
- Horizontal:
  - Add/remove nodes from the cluster
  - Auto-discovery allow your app to find nodes

- Vertical:
  - Scale up/down to larger/smaller node type
  - Scale up process:
    - Create a new cluster with the new node type
    - Update your application to use the new cluster's endpoints
    - Delete the old cluster
  - Memcached clusters/nodes start out empty
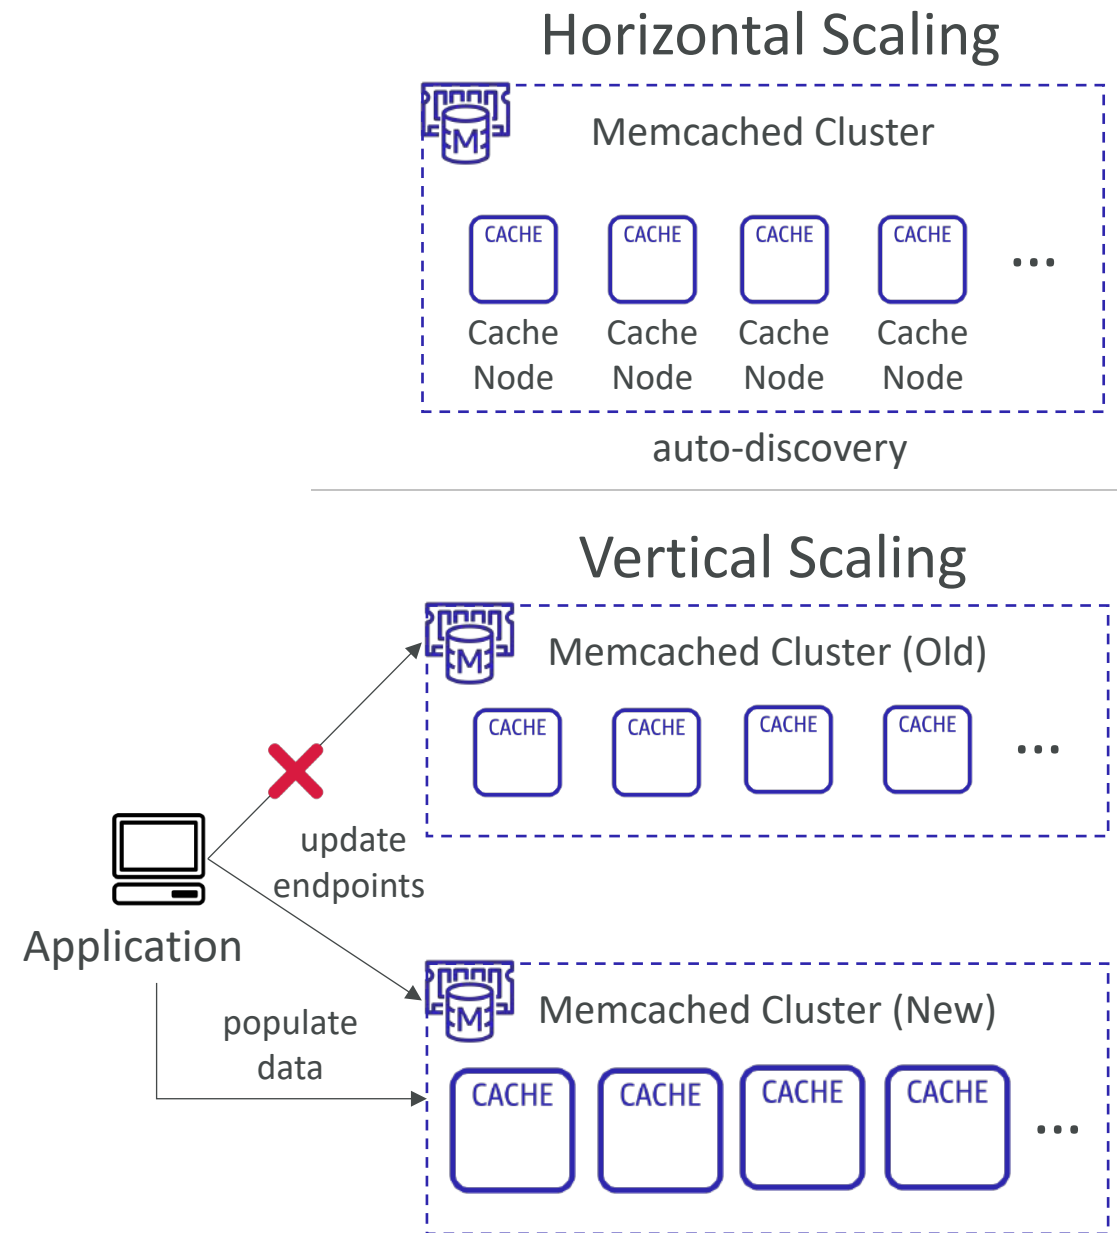

Memcached Auto Discovery

- Typically you need to manually connect to individual cache nodes in the cluster using its DNS endpoints
- Auto Discovery automatically identifies all of the nodes
- All the cache nodes in the cluster maintain a list of metadata about all other nodes
- This is seamless from a client perspective

Nodes' metadata:
Node 1: 12.28.33.24
Node 2: 43.52.61.27
…

Client

connect

Memcached Metrics to Monitor

- **Evictions:** the number of non-expired items the cache evicted to allow space for new writes (memory is overfilled). Solution:
  - Choose an eviction policy to evict expired items (e.g., LRU items)
  - Scale up to larger node type (more memory) or scale out by adding more nodes
- **CPUUtilization**
  - Solution: scale up to larger node type or scale out by adding more nodes
- **SwapUsage:** should not exceed 50 MB
- **CurrConnections:** the number of concurrent and active connections
  - Solution: investigate application behavior to address the issue
- **FreeableMemory:** amount of free memory on the host

AWS Monitoring, Audit & Performance

CloudWatch, CloudTrail & AWS Config

AWS CloudWatch Metrics

- CloudWatch provides metrics for *every* services in AWS
- **Metric** is a variable to monitor (CPUUtilization, NetworkIn…)
- Metrics belong to **namespaces**
- **Dimension** is an attribute of a metric (instance id, environment, etc…).
- Up to 30 dimensions per metric
- Metrics have **timestamps**
- Can create CloudWatch dashboards of metrics

EC2 Detailed monitoring

- EC2 instance metrics have metrics "every 5 minutes"

- With detailed monitoring (for a cost), you get data "every 1 minute"

- Use detailed monitoring if you want to scale faster for your ASG!

- The AWS Free Tier allows us to have 10 detailed monitoring metrics

- Note: EC2 Memory usage is by default not pushed (must be pushed from inside the instance as a custom metric)

CloudWatch Custom Metrics

- Possibility to define and send your own custom metrics to CloudWatch
- Example: memory (RAM) usage, disk space, number of logged in users …
- Use API call **PutMetricData**
- Ability to use dimensions (attributes) to segment metrics
  - Instance.id
  - Environment.name
- Metric resolution (**StorageResolution** API parameter – two possible value):
  - Standard: 1 minute (60 seconds)
  - High Resolution: 1/5/10/30 second(s) – Higher cost
- **Important:** Accepts metric data points two weeks in the past and two hours in the future (make sure to configure your EC2 instance time correctly)

CloudWatch Dashboards

- Great way to setup custom dashboards for quick access to key metrics and alarms
- **Dashboards are global**
- **Dashboards can include graphs from different <u>AWS accounts and regions</u>**
- You can change the time zone & time range of the dashboards
- You can setup automatic refresh (10s, 1m, 2m, 5m, 15m)
- Dashboards can be shared with people who don't have an AWS account (public, email address, 3rd party SSO provider through Amazon Cognito)

- Pricing:
  - 3 dashboards (up to 50 metrics) for free
  - $3/dashboard/month afterwards

CloudWatch Logs

- **Log groups:** arbitrary name, usually representing an application
- **Log stream:** instances within application / log files / containers
- Can define log expiration policies (never expire, 1 day to 10 years…)
- **CloudWatch Logs can send logs to:**
  - Amazon S3 (exports)
  - Kinesis Data Streams
  - Kinesis Data Firehose
  - AWS Lambda
  - OpenSearch
- Logs are encrypted by default
- Can setup KMS-based encryption with your own keys

CloudWatch Logs - Sources

- SDK, CloudWatch Logs Agent, CloudWatch Unified Agent

- Elastic Beanstalk: collection of logs from application

- ECS: collection from containers

- AWS Lambda: collection from function logs

- VPC Flow Logs: VPC specific logs

- API Gateway

- CloudTrail based on filter

- Route53: Log DNS queries

CloudWatch Logs Insights

www.datacumulus.com

© Stephane Maarek

CloudWatch Logs Insights

- Search and analyze log data stored in CloudWatch Logs

- Example: find a specific IP inside a log, count occurrences of "ERROR" in your logs…

- Provides a purpose-built query language
  - Automatically discovers fields from AWS services and JSON log events
  - Fetch desired event fields, filter based on conditions, calculate aggregate statistics, sort events, limit number of events…
  - Can save queries and add them to CloudWatch Dashboards

- Can query multiple Log Groups in different AWS accounts

- It's a query engine, not a real-time engine

CloudWatch Logs – S3 Export

CloudWatch Logs   Amazon S3

- Log data can take **up to 12 hours** to become available for export

- The API call is **CreateExportTask**

- Not near-real time or real-time… use Logs Subscriptions instead

CloudWatch Logs Subscriptions

- Get a real-time log events from CloudWatch Logs for processing and analysis
- Send to Kinesis Data Streams, Kinesis Data Firehose, or Lambda
- **Subscription Filter** – filter which logs are events delivered to your destination
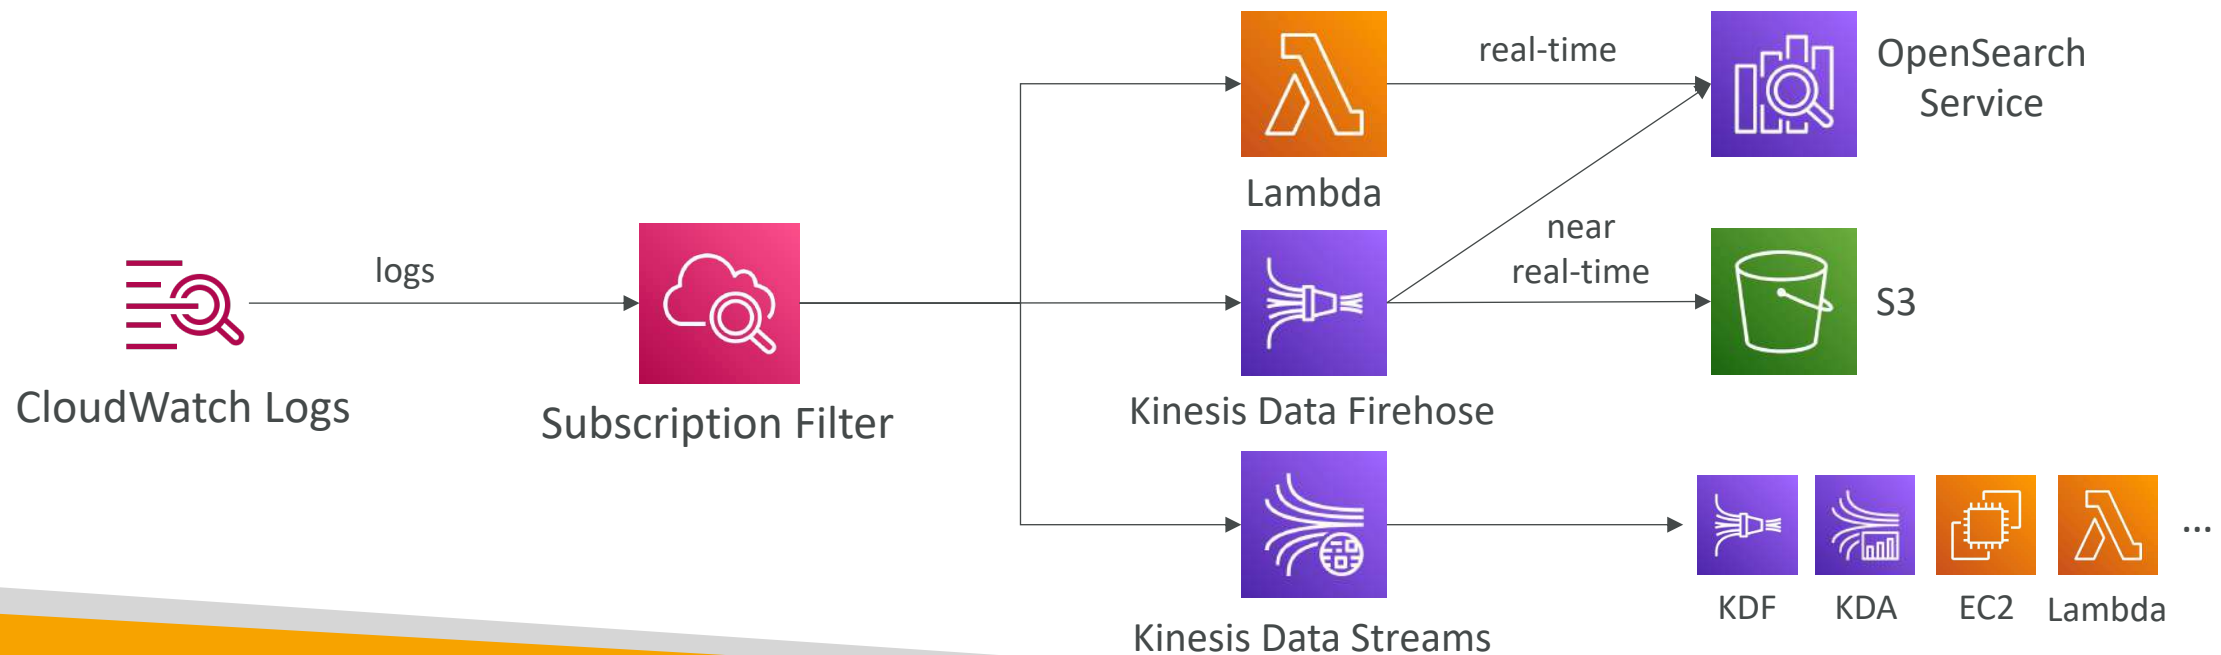

CloudWatch Logs Aggregation
Multi-Account & Multi Region

ACCOUNT A REGION 1

    ]
}
```

Destination Access Policy

CloudWatch Alarms

- Alarms are used to trigger notifications for any metric

- Various options (sampling, %, max, min, etc…)

- Alarm States:
  - OK
  - INSUFFICIENT_DATA
  - ALARM

- Period:
  - Length of time in seconds to evaluate the metric
  - High resolution custom metrics: 10 sec, 30 sec or multiples of 60 sec

CloudWatch Alarm Targets

- Stop, Terminate, Reboot, or Recover an EC2 Instance
- Trigger Auto Scaling Action
- Send notification to SNS (from which you can do pretty much anything)
Amazon EC2
EC2 Auto Scaling
Amazon SNS

CloudWatch Alarms – Composite Alarms

- CloudWatch Alarms are on a single metric
- **Composite Alarms are monitoring the states of multiple other alarms**
- AND and OR conditions
- Helpful to reduce "alarm noise" by creating complex composite alarms
EC2 Instance Recovery

- Status Check:
  - Instance status = check the EC2 VM
  - System status = check the underlying hardware
  - Attached EBS status = check attached EBS volumes
- **Recovery:** Same Private, Public, Elastic IP, metadata, placement group

CloudWatch Alarm: good to know

- Alarms can be created based on CloudWatch Logs Metrics Filters
- To test alarms and notifications, set the alarm state to Alarm using CLI

aws cloudwatch set-alarm-state --alarm-name "myalarm" --state-value ALARM --state-reason "testing purposes"

CloudWatch Synthetics Canary

- Configurable script that monitor your APIs, URLs, Websites, …
- Reproduce what your customers do programmatically to find issues before customers are impacted
- Checks the availability and latency of your endpoints and can store load time data and screenshots of the UI
- Integration with CloudWatch Alarms
- Scripts written in Node.js or Python
- Programmatic access to a headless Google Chrome browser
- Can run once or on a regular schedule

CloudWatch Synthetics Canary Blueprints

- **Heartbeat Monitor** – load URL, store screenshot and an HTTP archive file

- **API Canary** – test basic read and write functions of REST APIs

- **Broken Link Checker** – check all links inside the URL that you are testing

- **Visual Monitoring** – compare a screenshot taken during a canary run with a baseline screenshot

- **Canary Recorder** – used with CloudWatch Synthetics Recorder (record your actions on a website and automatically generates a script for that)

- **GUI Workflow Builder** – verifies that actions can be taken on your webpage (e.g., test a webpage with a login form)

Amazon EventBridge (formerly CloudWatch Events)

- Schedule: Cron jobs (scheduled scripts)

Schedule Every hour → **Trigger script on Lambda function**
- Event Pattern: Event rules to react to a service doing something

IAM Root User Sign in Event → **SNS Topic with Email Notification**
- Trigger Lambda functions, send SQS/SNS messages…

Amazon EventBridge Rules
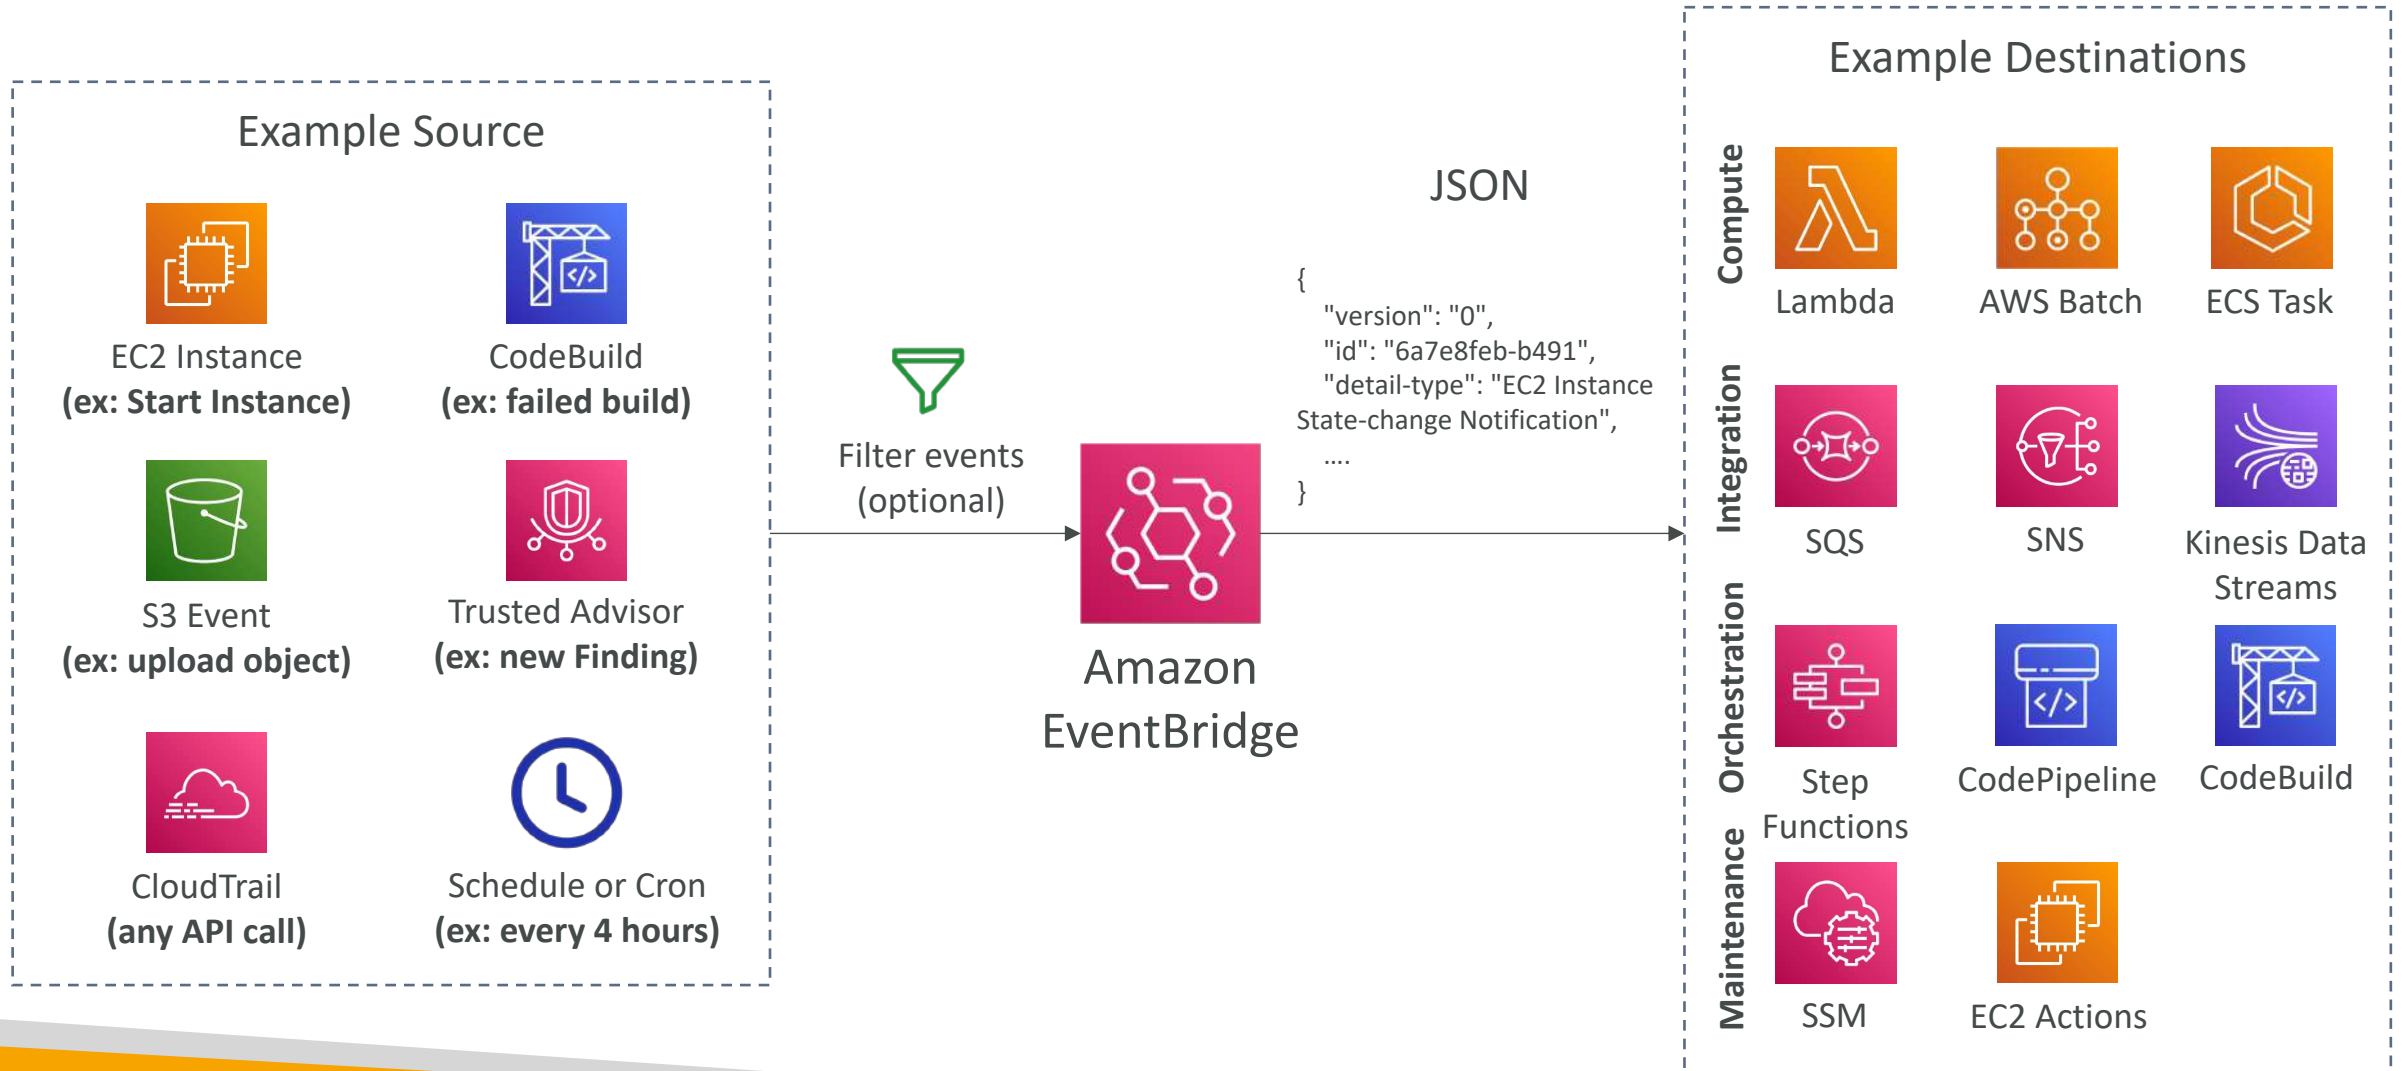

Amazon EventBridge

- Event buses can be accessed by other AWS accounts using Resource-based Policies

- You can **archive events** (all/filter) sent to an event bus (indefinitely or set period)
- Ability to **replay archived events**

Amazon EventBridge – Schema Registry

- EventBridge can analyze the events in your bus and infer the **schema**

- The **Schema Registry** allows you to generate code for your application, that will know in advance how data is structured in the event bus

- Schema can be versioned

Amazon EventBridge – Resource-based Policy

- Manage permissions for a specific Event Bus
- Example: allow/deny events from another AWS account or AWS region
- Use case: aggregate all events from your AWS Organization in a single AWS account or AWS region

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "events:PutEvents",
            "Principal": { "AWS": "111122223333" },
            "Resource": "arn:aws:events:us-east-1:123456789012:
event-bus/central-event-bus"
        }
    ]
}
```

Allow **events** from another AWS account

AWS Account (123456789012)

EventBridge Bus (central-event-bus)

PutEvents

AWS Account (111122223333)

Lambda function
Service Quotas CloudWatch Alarms

- Notify you when you're close to a service quota value threshold
- Create CloudWatch Alarms on the Service Quotas console
- Example: Lambda concurrent executions
- Helps you know if you need to request a quota increase or shutdown resources before limit is reached

AWS Lambda Quota

monitor

AWS Service Quotas

⚠ trigger

CW Alarm
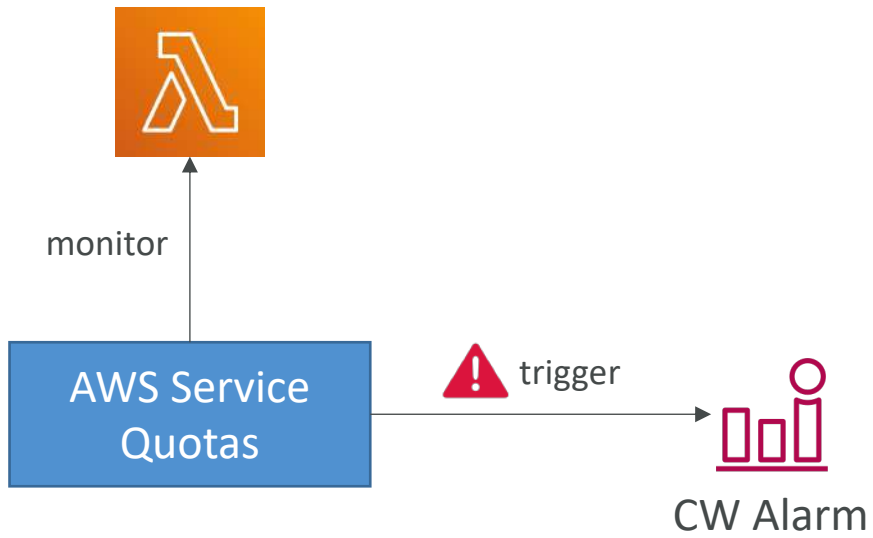

Create a CloudWatch alarm: Concurrent executions   ✕

Description
The maximum number of events that functions can process simultaneously in the current Region.

Alarm threshold
This alarm will notify you based on the threshold you choose.

900

Alarm name

LambdaConcurrentExecutionsExceededAlarm

Required. Alarm names must be unique within an AWS account.

Region
US East (N. Virginia) us-east-1

Pricing
Using CloudWatch can incur costs. CloudWatch pricing ↗

Cancel   Create

Alternative: Trusted Advisor + CW Alarms

- Limited number of Service Limits checks in Trusted Advisor (~50)
- Trusted Advisor publishes its check results to CloudWatch
- You can create CloudWatch Alarms on service quota usage (Service Limits)

Lambda Concurrent Executions: 1000

Service Limits → trigger

AWS Trusted Advisor   CloudWatch   CW Alarm
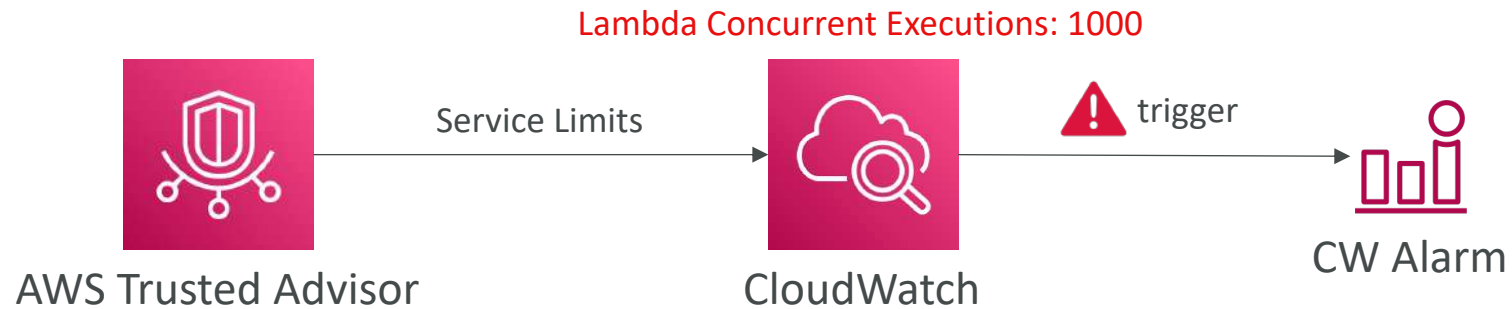

AWS CloudTrail

- Provides governance, compliance and audit for your AWS Account

- CloudTrail is enabled by default!

- Get an history of events / API calls made within your AWS Account by:
  - Console
  - SDK
  - CLI
  - AWS Services

- Can put logs from CloudTrail into CloudWatch Logs or S3

- A trail can be applied to All Regions (default) or a single Region.

- If a resource is deleted in AWS, investigate CloudTrail first!

CloudWatch Logs

S3 Bucket
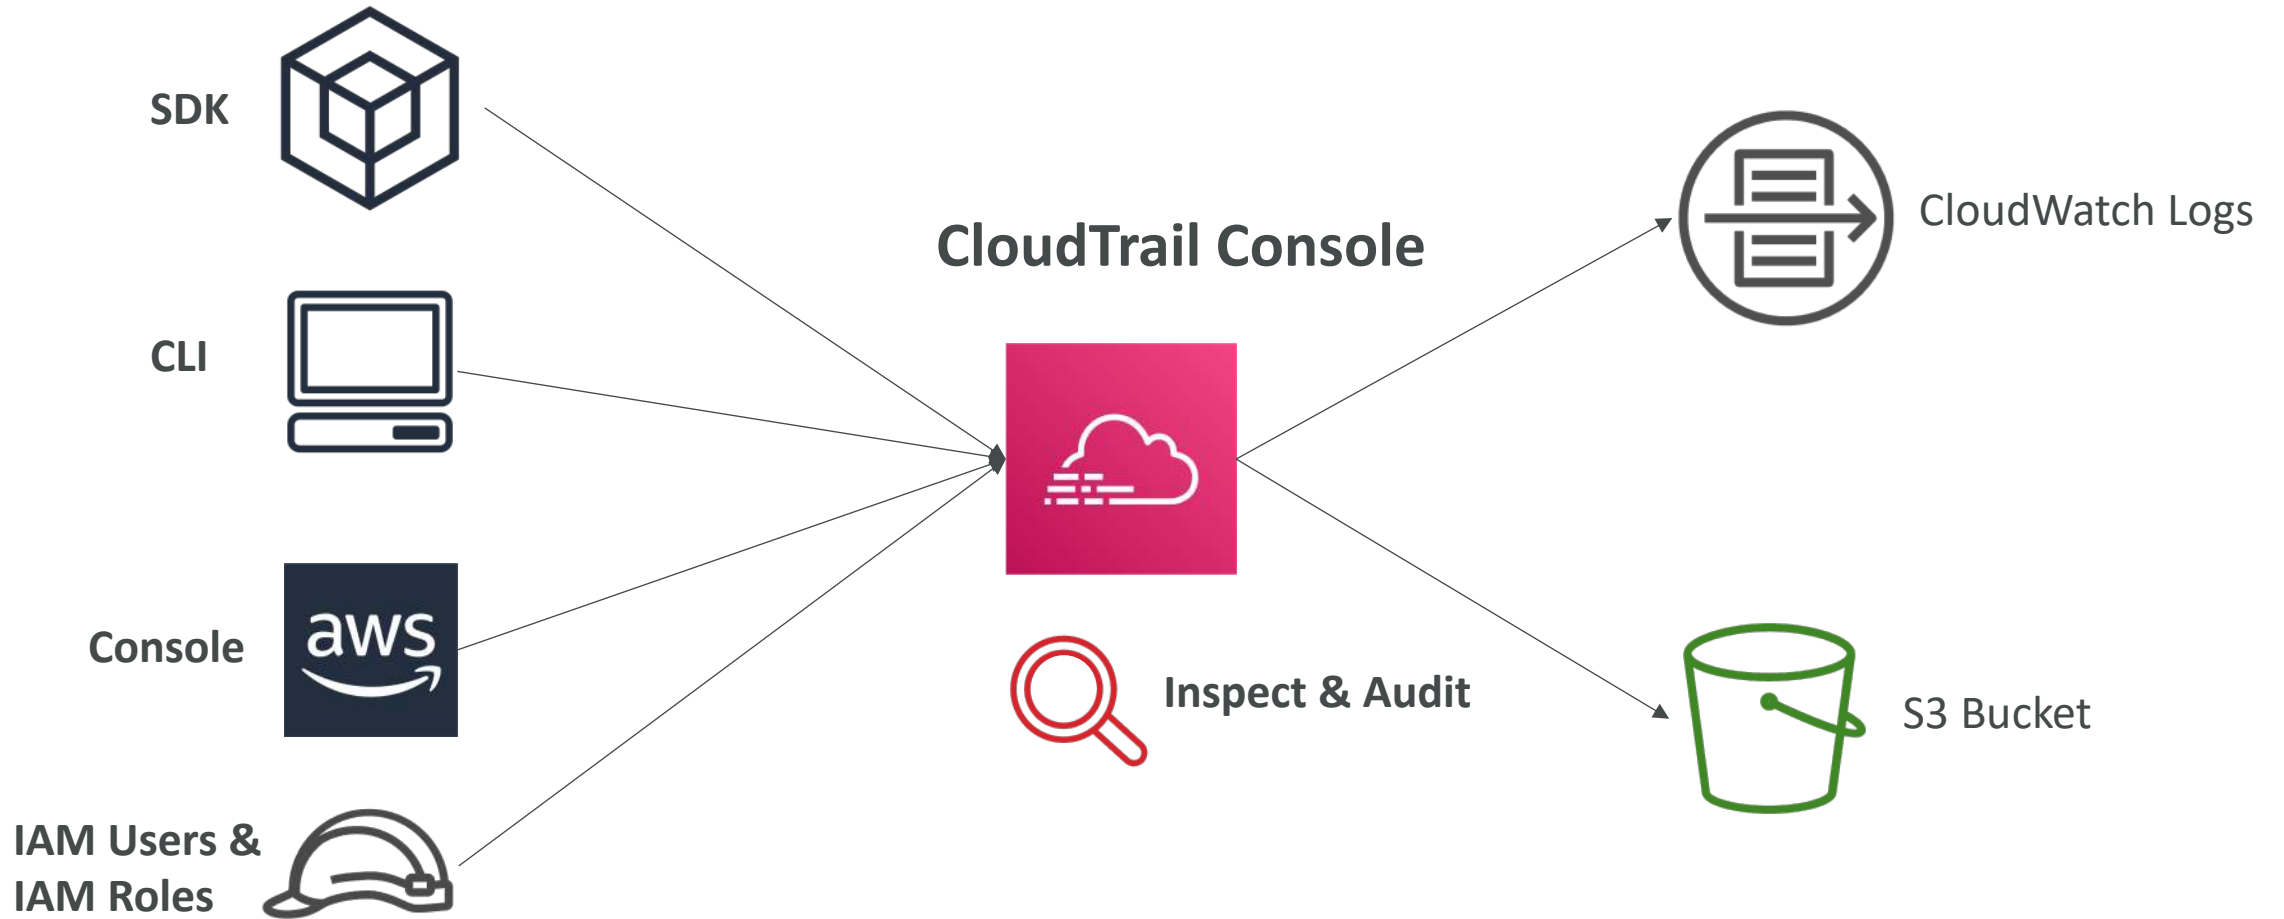

CloudTrail Events

- Management Events:
  - Operations that are performed on resources in your AWS account
  - Examples:
    - Configuring security (IAM `AttachRolePolicy`)
    - Configuring rules for routing data (Amazon EC2 `CreateSubnet`)
    - Setting up logging (AWS CloudTrail `CreateTrail`)
  - **By default, trails are configured to log management events.**
  - Can separate **Read Events** (that don't modify resources) from **Write Events** (that may modify resources)

- Data Events:
  - **By default, data events are not logged (because high volume operations)**
  - Amazon S3 object-level activity (ex: `GetObject`, `DeleteObject`, `PutObject`): can separate Read and Write Events
  - AWS Lambda function execution activity (the `Invoke` API)

- CloudTrail Insights Events:
  - See next slide ☺

CloudTrail Insights

- Enable **CloudTrail Insights to detect unusual activity** in your account:
  - inaccurate resource provisioning
  - hitting service limits
  - Bursts of AWS IAM actions
  - Gaps in periodic maintenance activity
- CloudTrail Insights analyzes normal management events to create a baseline
- And then **continuously analyzes <u>write</u> events to detect unusual patterns**
  - Anomalies appear in the CloudTrail console
  - Event is sent to Amazon S3
  - An EventBridge event is generated (for automation needs)

Management Events → Continous analysis → **CloudTrail Insights** → generate → **Insights Events** → **CloudTrail Console** / **S3 Bucket** / **EventBridge event**
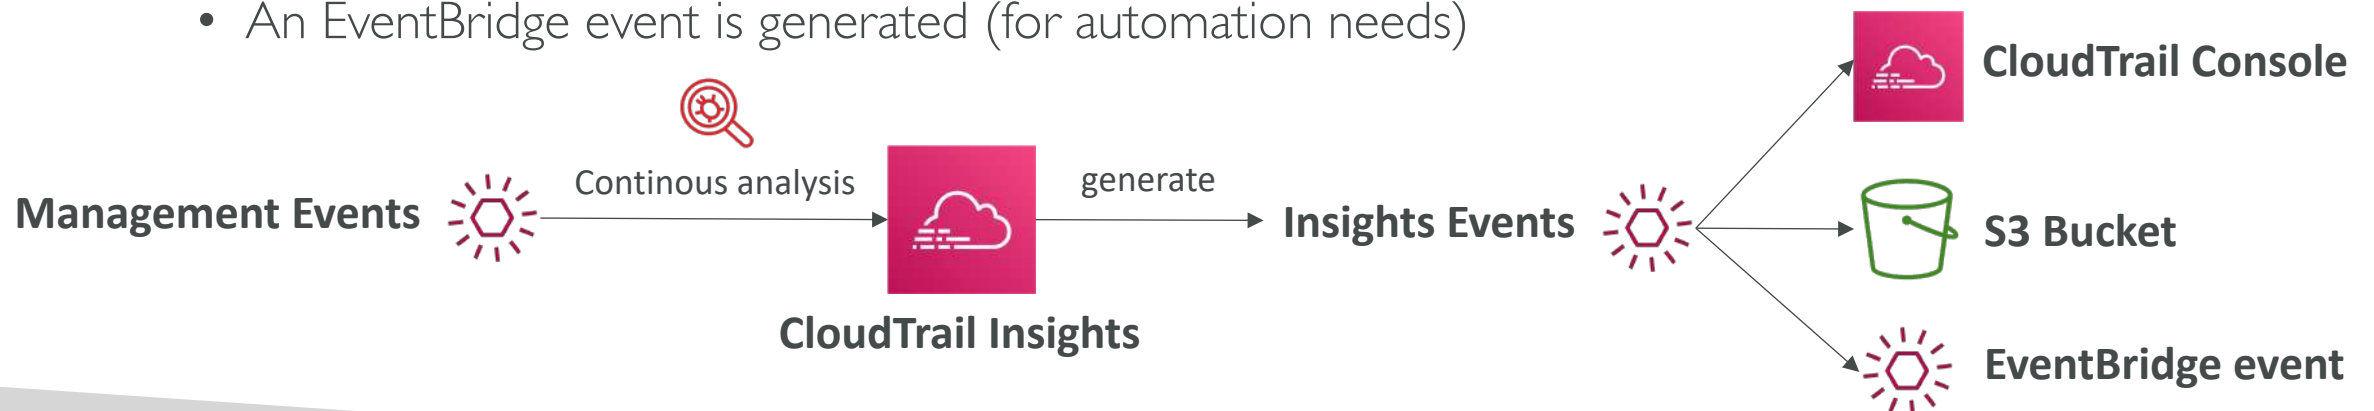

CloudTrail Events Retention

- Events are stored for 90 days in CloudTrail
- To keep events beyond this period, log them to S3 and use Athena

Amazon EventBridge – Intercept API Calls

User

DeleteTable API Call 💥

DynamoDB → Log API call → CloudTrail (any API call) → event → Amazon EventBridge → alert → SNS
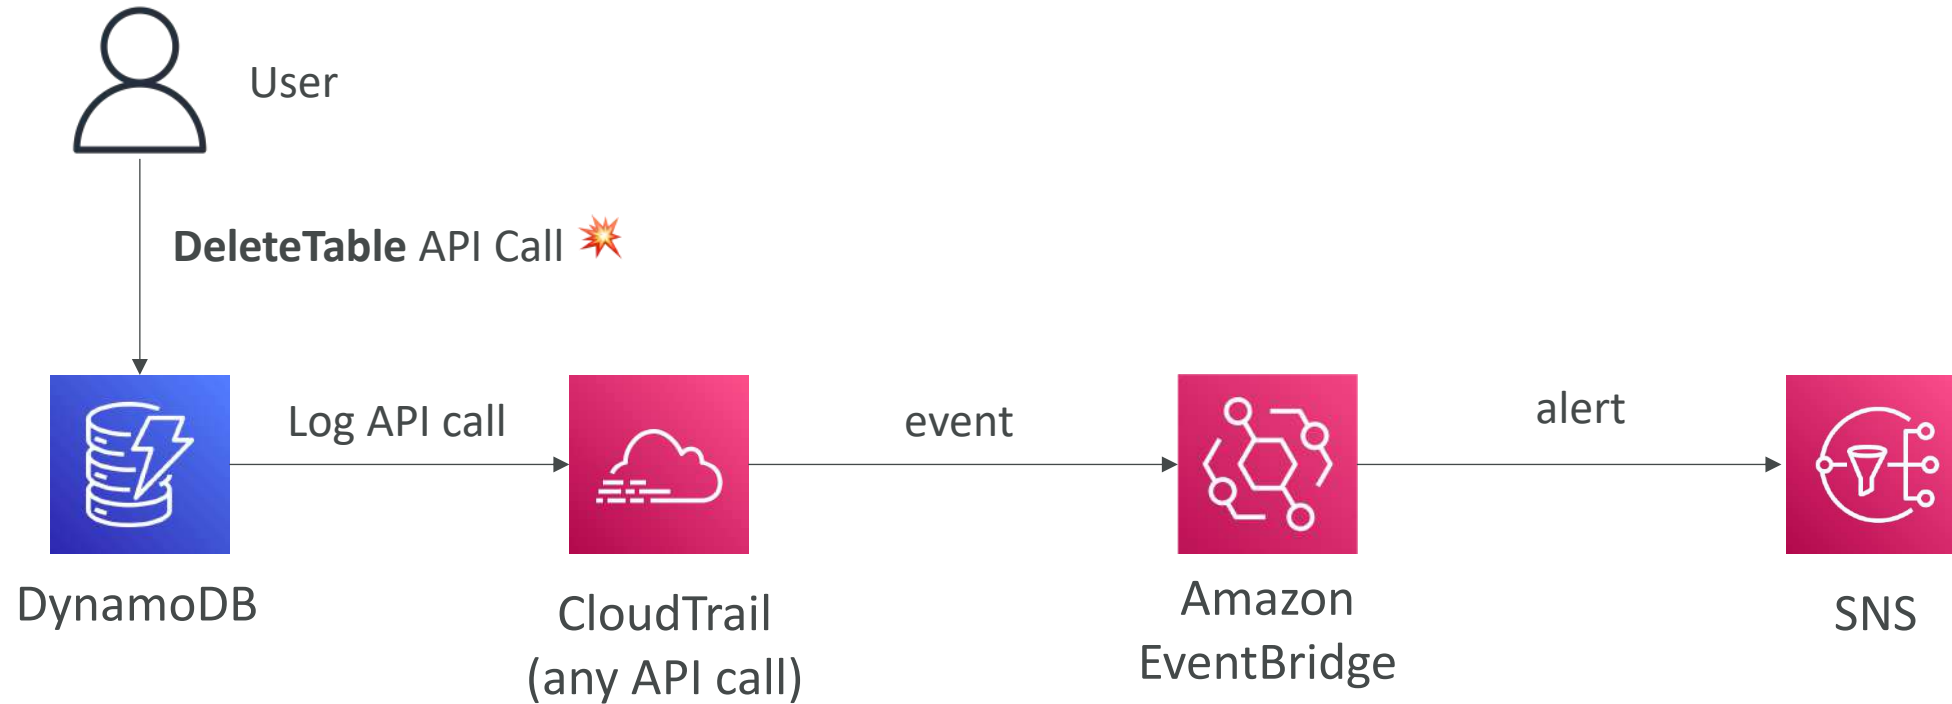

Amazon EventBridge + CloudTrail

IAM   API Call logs → CloudTrail → event → EventBridge → SNS

User — **AssumeRole** → IAM Role

EC2   API Call logs → CloudTrail → event → EventBridge → SNS

AuthorizeSecurityGroupIngress

User — edit SG Inbound Rules → Security Group

© Stephane Maarek
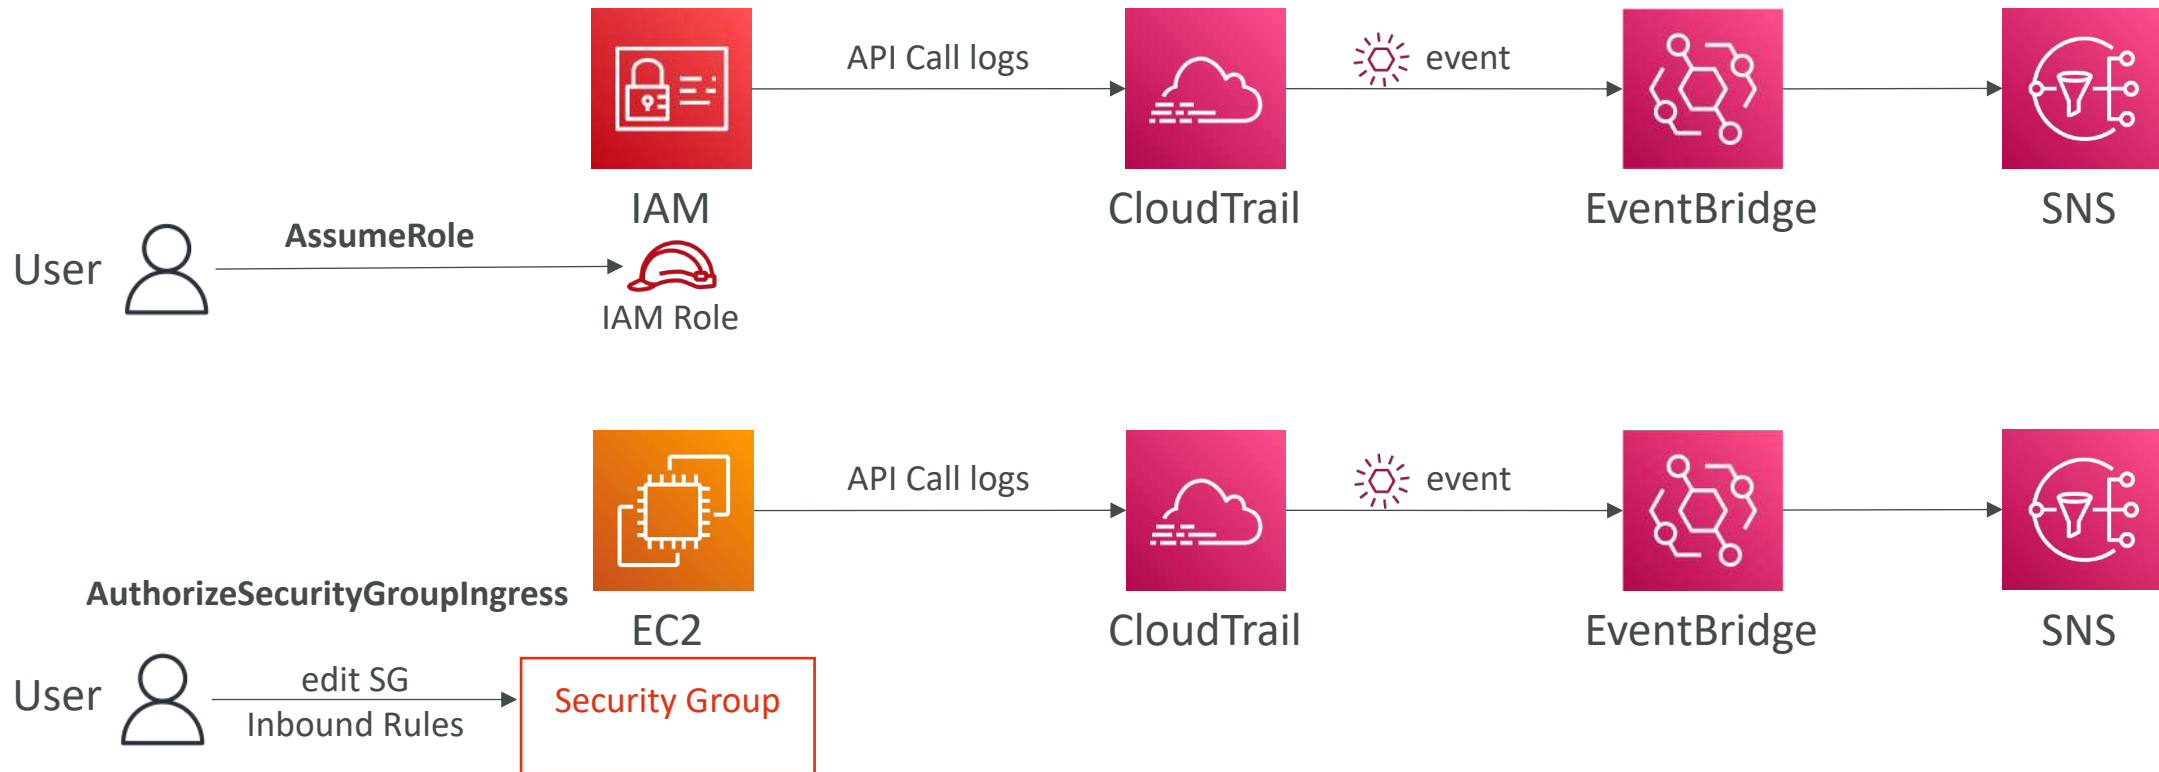

CloudTrail – Log File Integrity Validation

- Digest Files:
  - References the log files for the last hour and contains a hash of each
  - Stored in the same S3 bucket as log files (different folder)
- Helps you determine whether a log file was modified/deleted after CloudTrail delivered it
- Hashing using SHA-256, Digital Signing using SHA-256 with RSA
- Protect the S3 bucket using bucket policy, versioning, MFA Delete protection, encryption, object lock
- Protect CloudTrail using IAM

start instance

API calls

CloudTrail

Amazon EC2

logs

Log Files (1 hour)

...

reference

contains a hash of each log file

Digest File
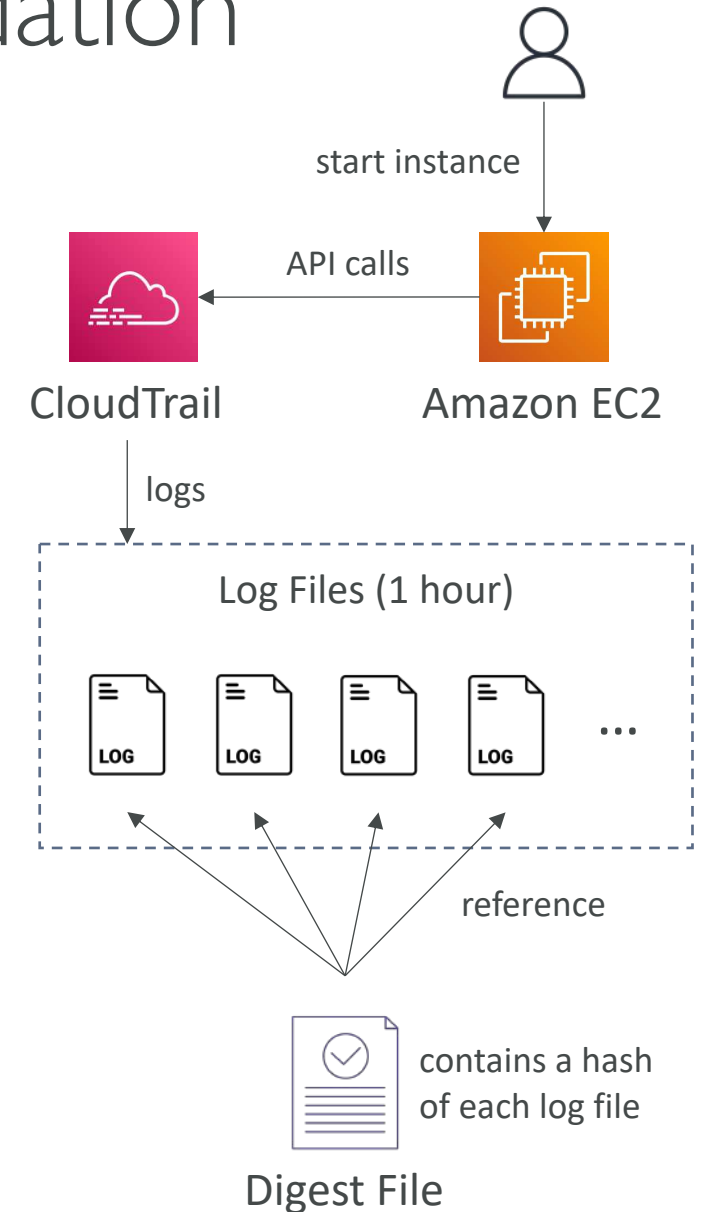

CloudTrail – Integration with EventBridge
- Used to react to any API call being made in your account
- CloudTrail is not "real-time":
  - Delivers an event within 15 minutes of an API call
  - Delivers log files to an S3 bucket every 5 minutes

CloudTrail – Organizations Trails

- A trail that will log all events for all AWS accounts in an AWS Organization
- Log events for management and member accounts
- Trail with the same name will be created in every AWS account (IAM permissions)
- Member accounts can't remove or modify the organization trail (view only)
AWS Config
- Helps with auditing and recording **compliance** of your AWS resources
- Helps record configurations and changes over time
- Questions that can be solved by AWS Config:
  - Is there unrestricted SSH access to my security groups?
  - Do my buckets have any public access?
  - How has my ALB configuration changed over time?
- You can receive alerts (SNS notifications) for any changes
- AWS Config is a per-region service
- Can be aggregated across regions and accounts
- Possibility of storing the configuration data into S3 (analyzed by Athena)

Config Rules

- Can use AWS managed config rules (over 75)
- Can make custom config rules (must be defined in AWS Lambda)
  - Ex: evaluate if each EBS disk is of type gp2
  - Ex: evaluate if each EC2 instance is t2.micro
- Rules can be evaluated / triggered:
  - For each config change
  - And / or: at regular time intervals
- AWS Config Rules does not prevent actions from happening (no deny)

- Pricing: no free tier, $0.003 per configuration item recorded per region, $0.001 per config rule evaluation per region

AWS Config Resource

- View compliance of a resource over time

- View configuration of a resource over time
- View CloudTrail API calls of a resource over time
Config Rules – Remediations

- Automate remediation of non-compliant resources using SSM Automation Documents
- Use AWS-Managed Automation Documents or create custom Automation Documents
  - Tip: you can create custom Automation Documents that invokes Lambda function
- You can set **Remediation Retries** if the resource is still non-compliant after auto-remediation

expired

IAM Access Key
(NON_COMPLIANT)

monitor

AWS Config

trigger

Auto-Remediation Action
(SSM Document: AWSConfigRemediation-RevokeUnusedIAMUserCredentials)

Retries: 5

⊘ deactivate
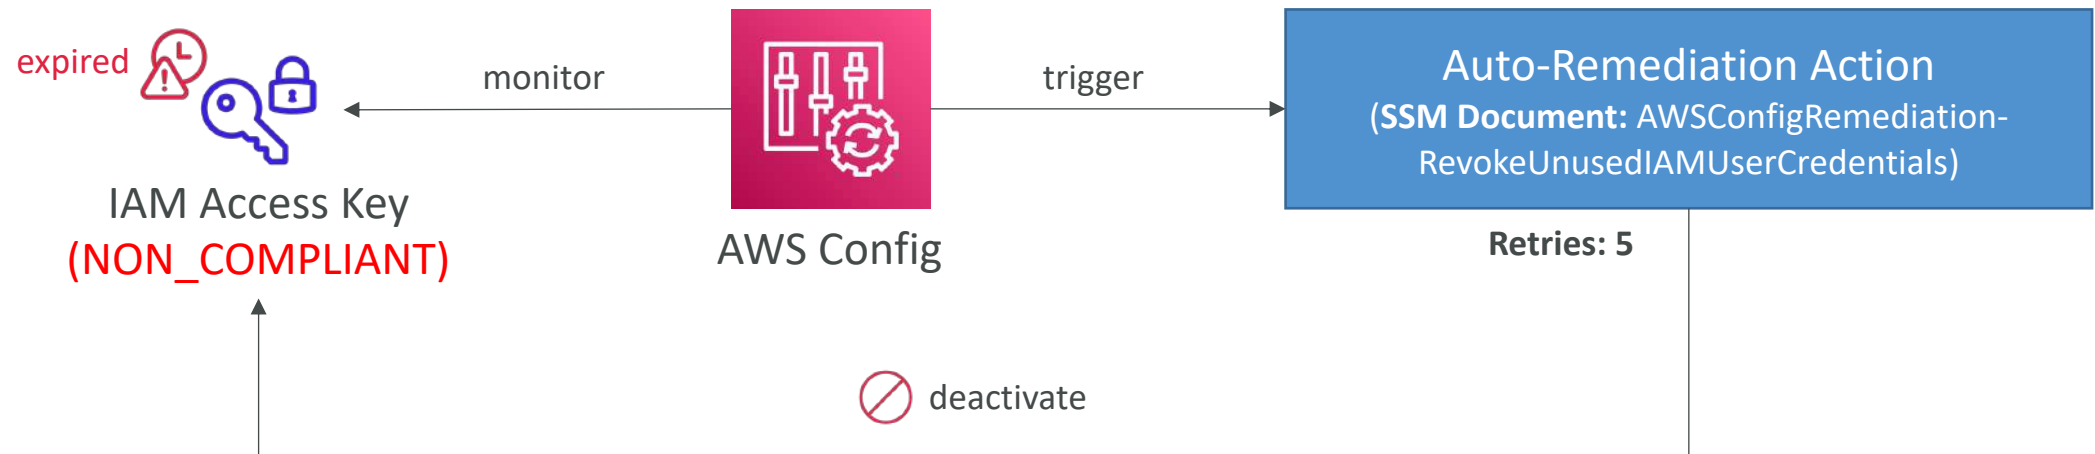

Config Rules – Notifications

- Use EventBridge to trigger notifications when AWS resources are non-compliant
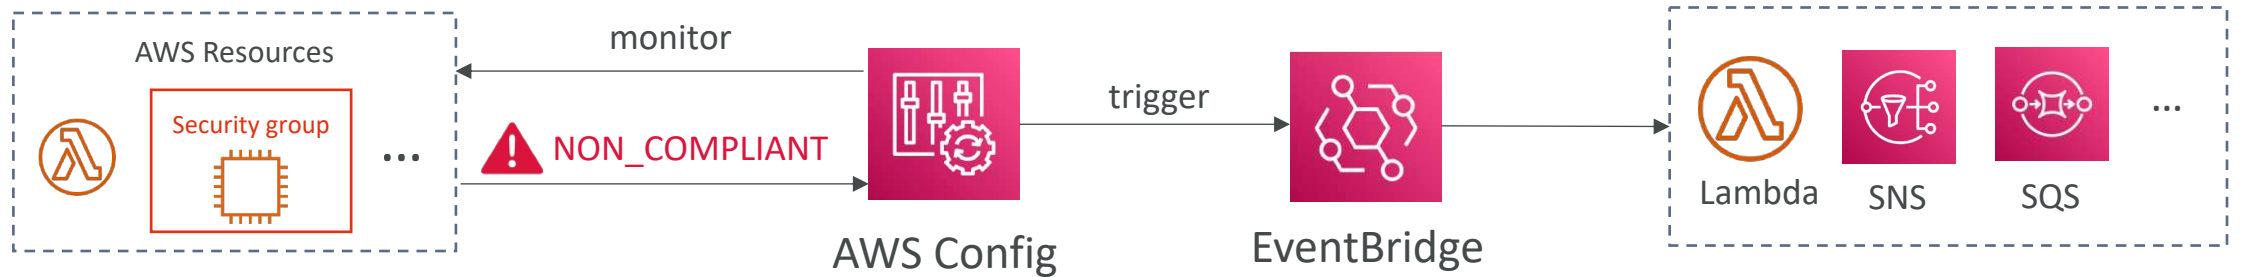

- Ability to send configuration changes and compliance state notifications to SNS (all events – use SNS Filtering or filter at client-side)
AWS Config – Aggregators
- The aggregator is created in one central aggregator account
- Aggregates rules, resources, etc… across multiple accounts & regions
- If using AWS Organizations, no need for individual Authorization
- Rules are created in each individual source AWS account
- Can deploy rules to multiple target accounts using CloudFormation StackSets

CloudWatch vs CloudTrail vs Config

- CloudWatch
  - Performance monitoring (metrics, CPU, network, etc…) & dashboards
  - Events & Alerting
  - Log Aggregation & Analysis
- CloudTrail
  - Record API calls made within your Account by everyone
  - Can define trails for specific resources
  - Global Service
- Config
  - Record configuration changes
  - Evaluate resources against compliance rules
  - Get timeline of changes and compliance

For an Elastic Load Balancer

- CloudWatch:
  - Monitoring Incoming connections metric
  - Visualize error codes as a % over time
  - Make a dashboard to get an idea of your load balancer performance
- Config:
  - Track security group rules for the Load Balancer
  - Track configuration changes for the Load Balancer
  - Ensure an SSL certificate is always assigned to the Load Balancer (compliance)
- CloudTrail:
  - Track who made any changes to the Load Balancer with API calls

AWS Account Management

Health Dashboards, AWS Organizations and Billing Console

AWS Health Dashboard - Service History

- Shows all regions, all services health

- Shows historical information for each day

- Has an RSS feed you can subscribe to

- Previously called AWS Service Health Dashboard

AWS Health Dashboard – Your Account

- Previously called AWS Personal Health Dashboard (PHD)
- AWS Account Health Dashboard provides **alerts and remediation guidance** when AWS is experiencing **events that may impact you**.
- While the Service Health Dashboard displays the general status of AWS services, Account Health Dashboard gives you a **personalized view into the performance and availability of the AWS services underlying your AWS resources.**
- The dashboard displays **relevant and timely information** to help you manage events in progress and provides **proactive notification** to help you plan for **scheduled activities.**
- Can aggregate data from an entire AWS Organization

AWS Health Dashboard – Your Account

- Global service
- Shows how AWS outages directly impact you & your AWS resources
- Alert, remediation, proactive, scheduled activities

Open issues	0
Scheduled changes	0
Other notifications	0

Operational issue – Codecatalyst (Oregon)	Closed	Issue	us-west-2	December 21, 2022 at 3:03:57 PM UTC	December 21, 2022 at 4:50:47 PM UTC	-
Operational issue – Amplify (N. Virginia)	Closed	Issue	us-east-1	December 17, 2022 at 2:24:17 PM UTC	December 17, 2022 at 2:43:21 PM UTC	-
Operational issue – Multiple services (Singapore)	Closed	Issue	ap-southeast-1	December 13, 2022 at 10:00:55 PM UTC	December 14, 2022 at 1:01:16 AM UTC	-

Health Event Notifications

- Use EventBridge to react to changes for AWS Health events in your AWS account

- Example: receive email notifications when EC2 instances in your AWS account are scheduled for updates

- This is possible for Account events (resources that are affected in your account) and Public Events (Regional availability of a service)

- Use cases: send notifications, capture event information, take corrective action...

Instance Scheduled for Retirement
→ EventBridge

Restart Instance → EC2
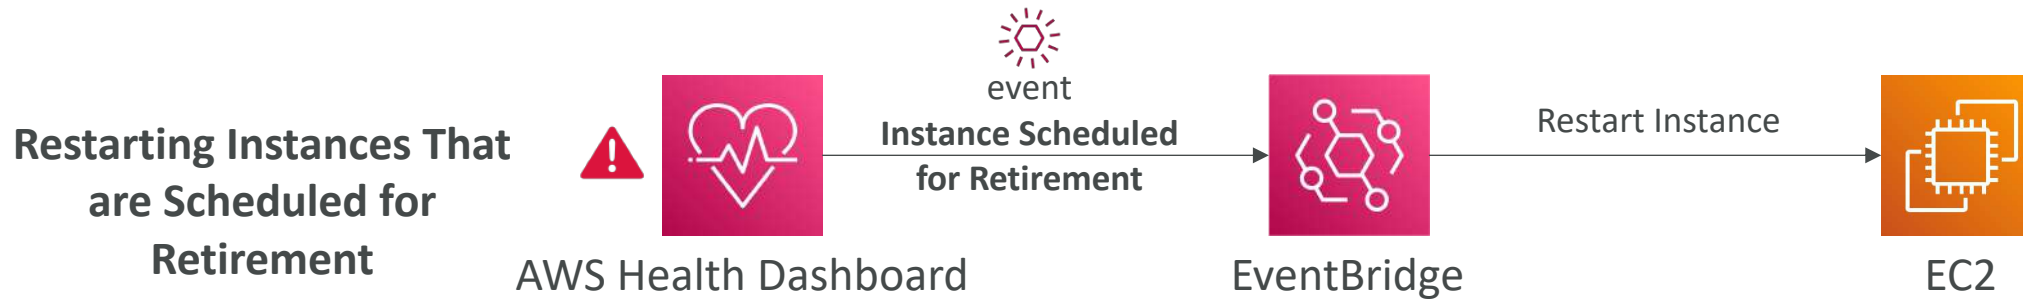

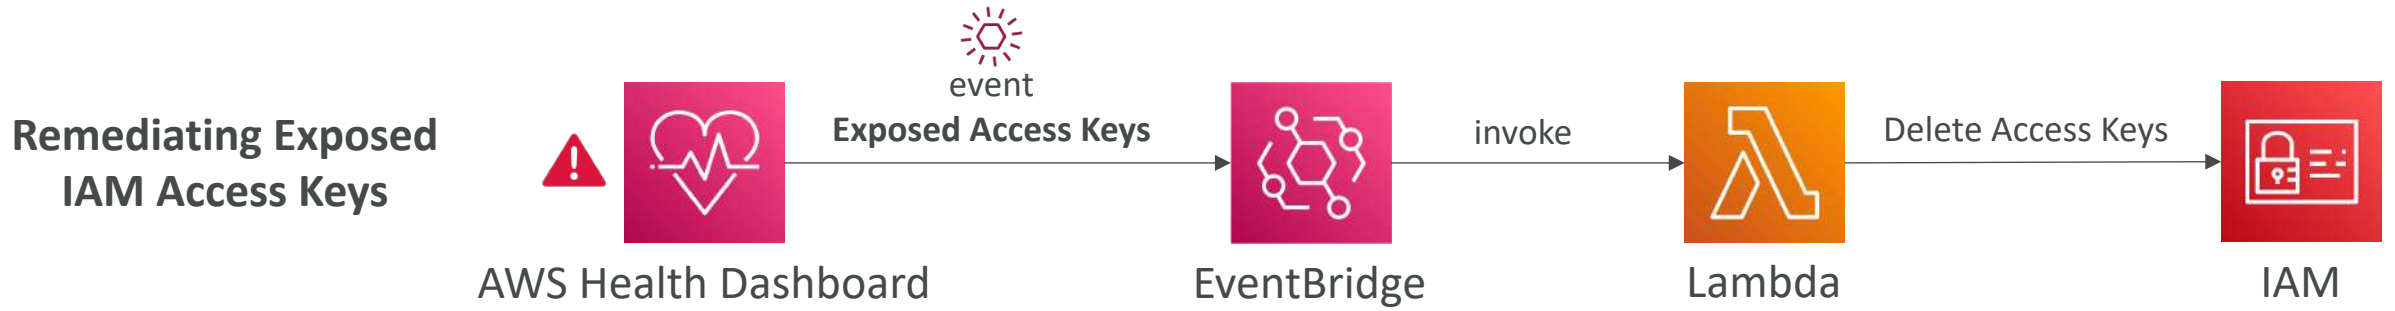

AWS Organizations

- Global service
- Allows to manage multiple AWS accounts
- The main account is the management account
- Other accounts are member accounts
- Member accounts can only be part of one organization
- Consolidated Billing across all accounts - single payment method
- Pricing benefits from aggregated usage (volume discount for EC2, S3…)
- **Shared reserved instances and Savings Plans discounts across accounts**
- API is available to automate AWS account creation

AWS Organizations
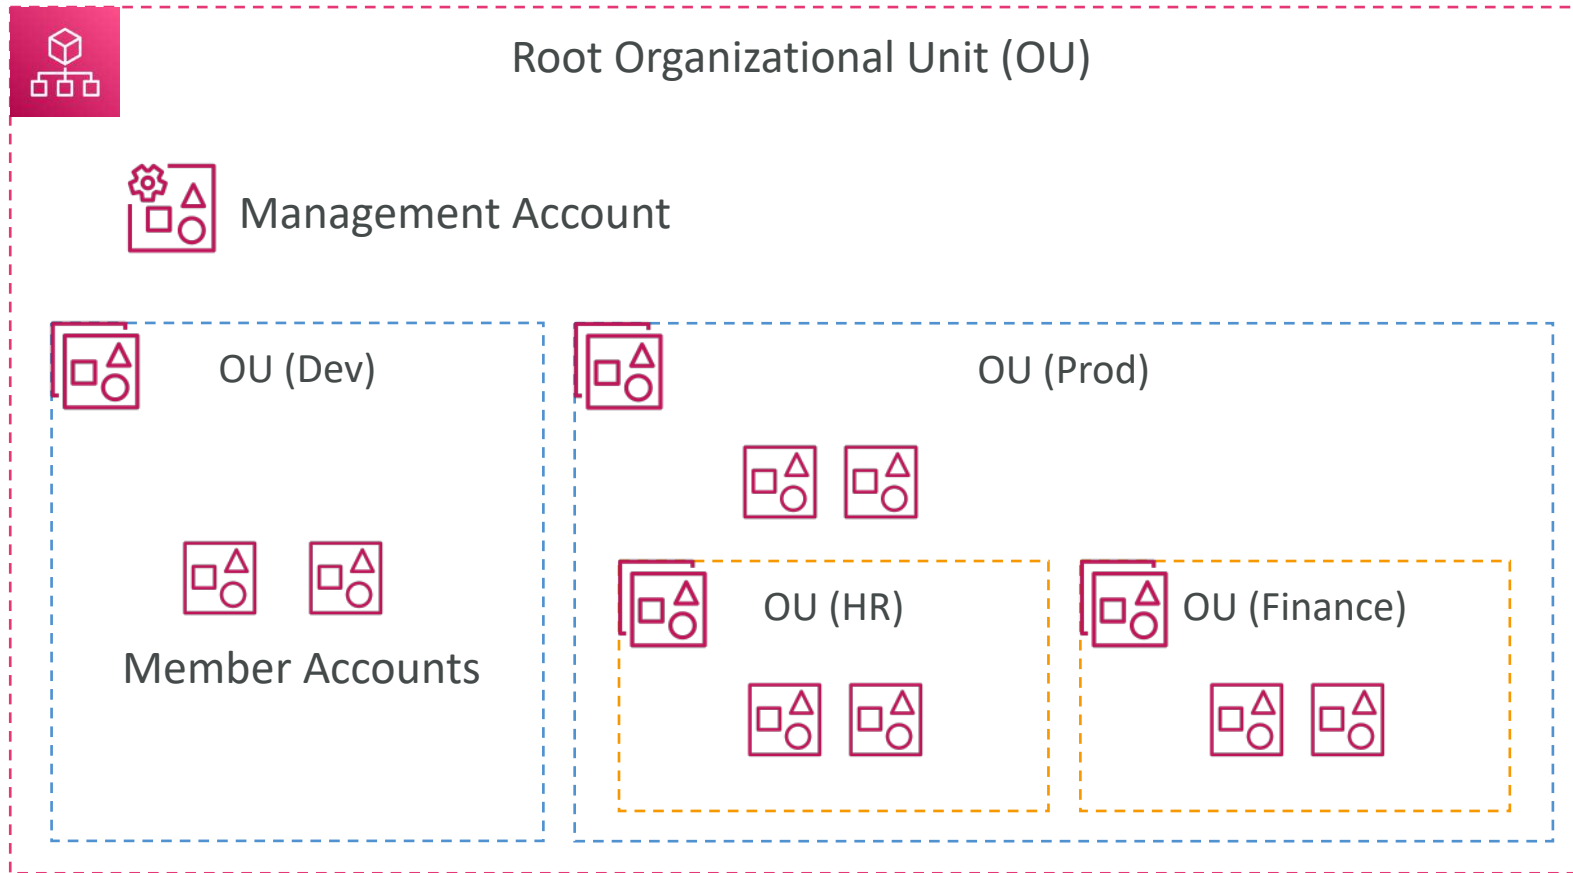

Organizational Units (OU) - Examples
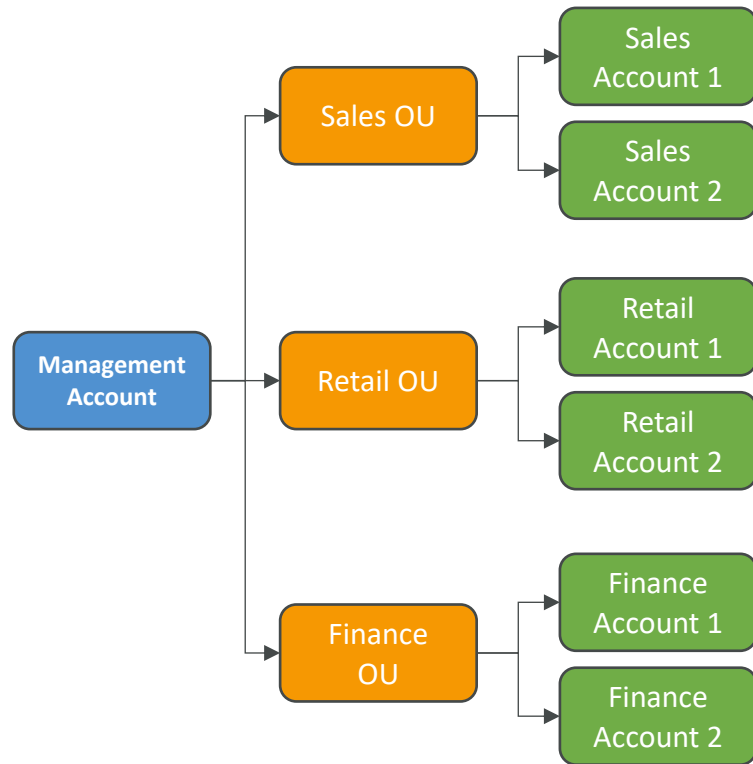

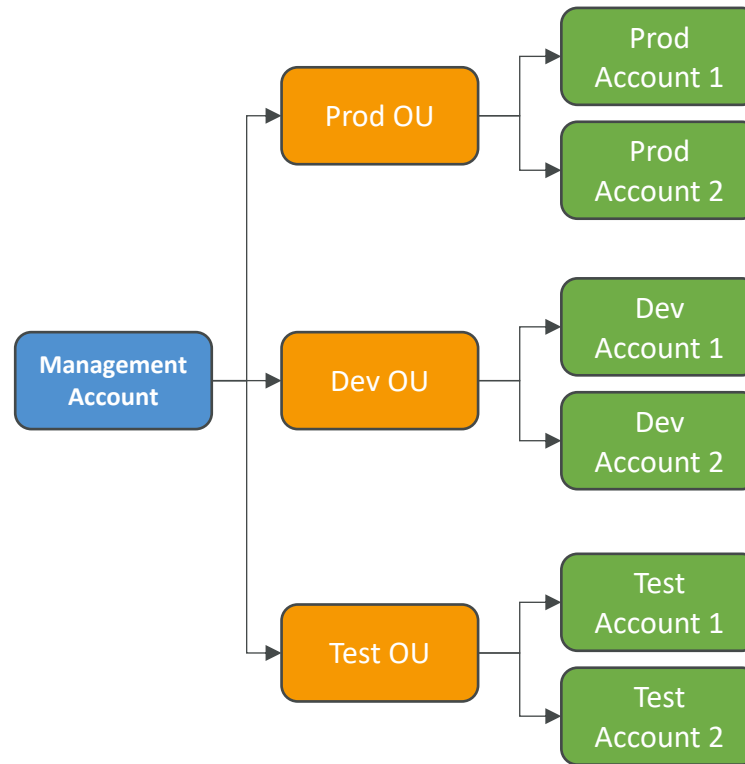

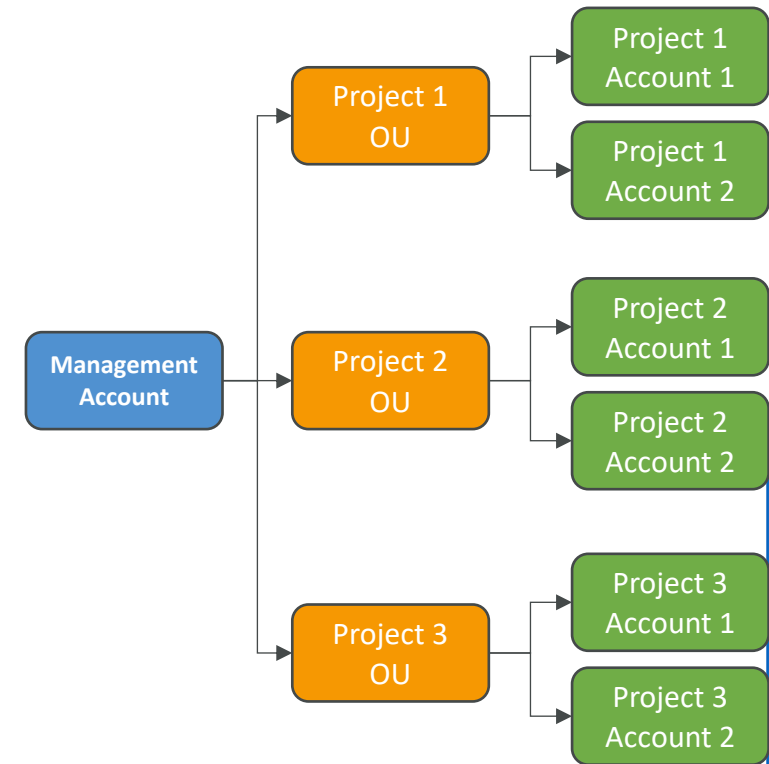

AWS Organizations

- Advantages
  - Multi Account vs One Account Multi VPC
  - Use tagging standards for billing purposes
  - Enable CloudTrail on all accounts, send logs to central S3 account
  - Send CloudWatch Logs to central logging account
  - Establish Cross Account Roles for Admin purposes

- Security: Service Control Policies (SCP)
  - IAM policies applied to OU or Accounts to restrict Users and Roles
  - They do not apply to the management account (full admin power)
  - Must have an explicit allow from the root through each OU in the direct path to the target account (does not allow anything by default – like IAM)

SCP Hierarchy

FullAWSAccess → OU **(Root)**

Deny Athena → Management Account

FullAWSAccess

FullAWSAccess + **Deny** S3 → OU **(Sandbox)**

Allow EC2

FullAWSAccess + **Deny** EC2 → Account A

FullAWSAccess

OU **(Workloads)**

OU **(Test)**

Account D

OU **(Prod)**

Account B

Account C
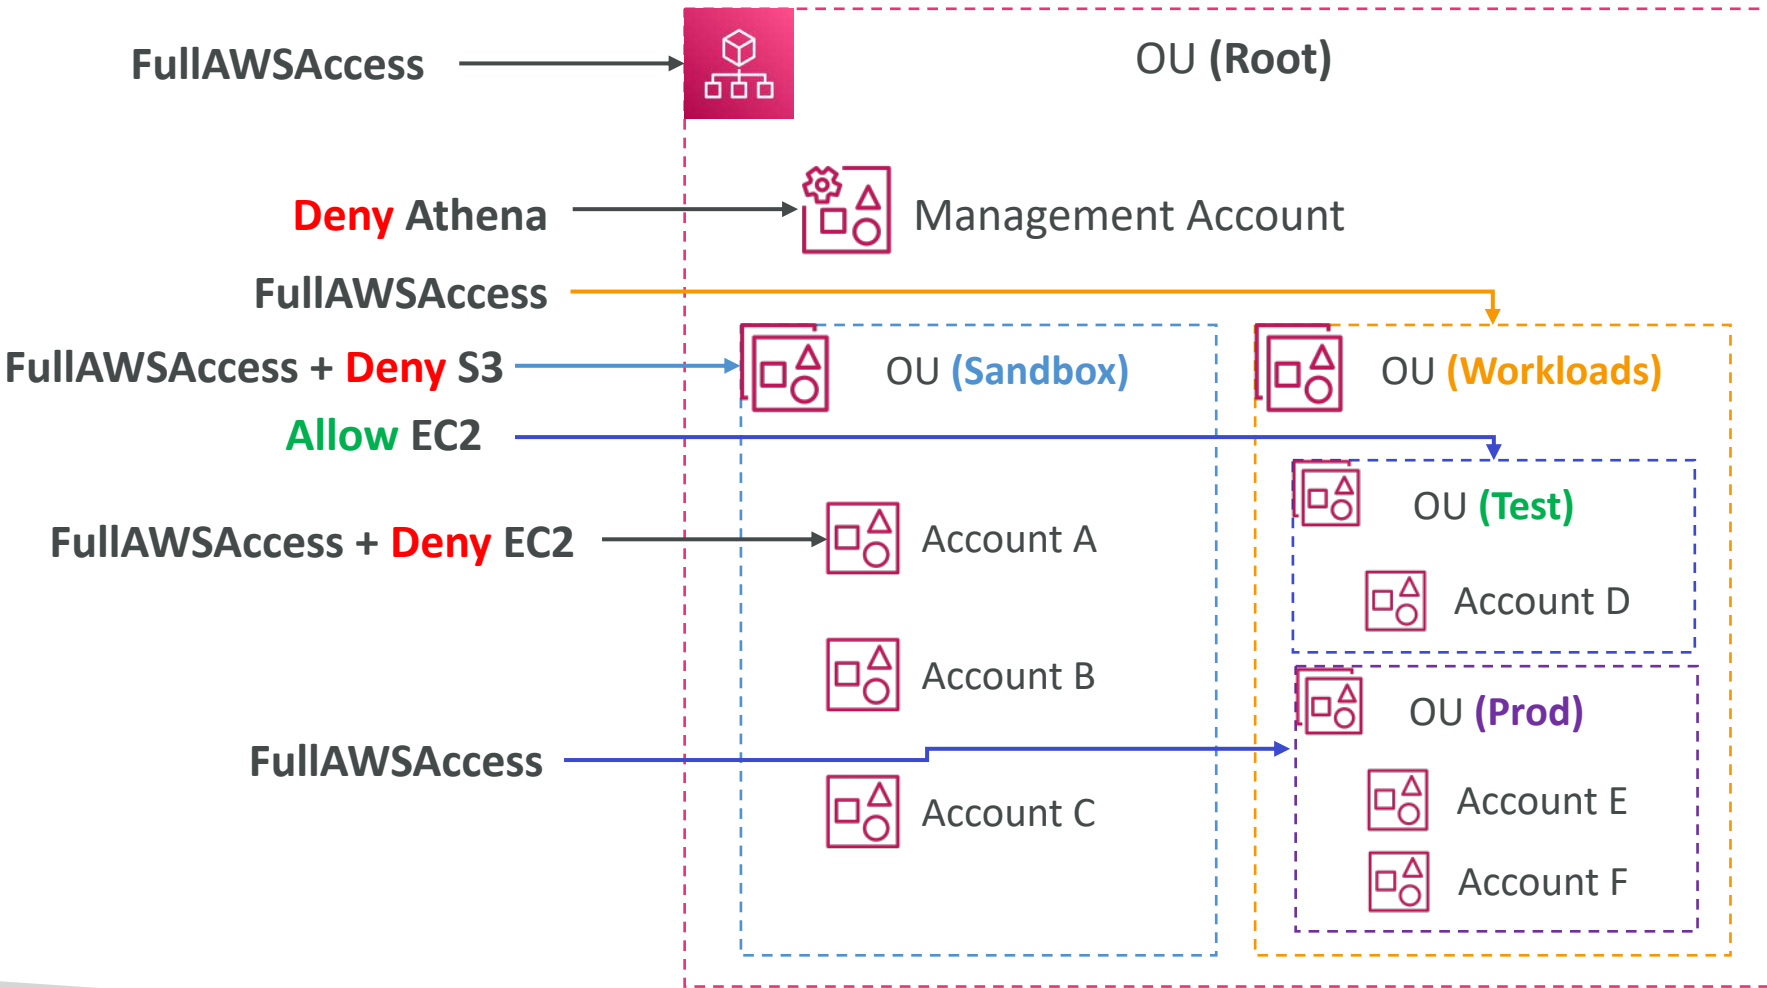

Account E

Account F

- Management Account
  - Can do anything (no SCP apply)
- Account A
  - Can do anything
  - EXCEPT S3 (explicit Deny from Sandbox OU)
  - EXCEPT EC2 (explicit Deny)
- Account B & C
  - Can do anything
  - EXCEPT S3 (explicit Deny from Sandbox OU)
- Account D
  - Can access EC2
- Prod OU & Account E & F
  - Can do anything

                "ec2:*",
                "cloudwatch:*"
            ],
            "Resource": "*"

        }

    ]
}
```

More examples: https://docs.aws.amazon.com/organizations/latest/userguide/orgs_manage_policies_example-scps.html

AWS Organizations – Reserved Instances

- For billing purposes, the consolidated billing feature of AWS Organizations treats all the accounts in the organization as one account.

- This means that **all accounts** in the organization can receive the hourly cost benefit of Reserved Instances that are purchased **by any other account.**

- **The payer account (master account) of an organization** can turn off Reserved Instance (RI) discount and Savings Plans discount sharing for any accounts in that organization, including the payer account

- This means that RIs and Savings Plans discounts aren't shared between any accounts that have sharing turned off.

- To share an RI or Savings Plans discount with an account, both accounts must have sharing turned on.

AWS Organizations – IAM Policies

- Use **aws:PrincipalOrgID** condition key in your resource-based policies to restrict access to IAM principals from accounts in an AWS Organization
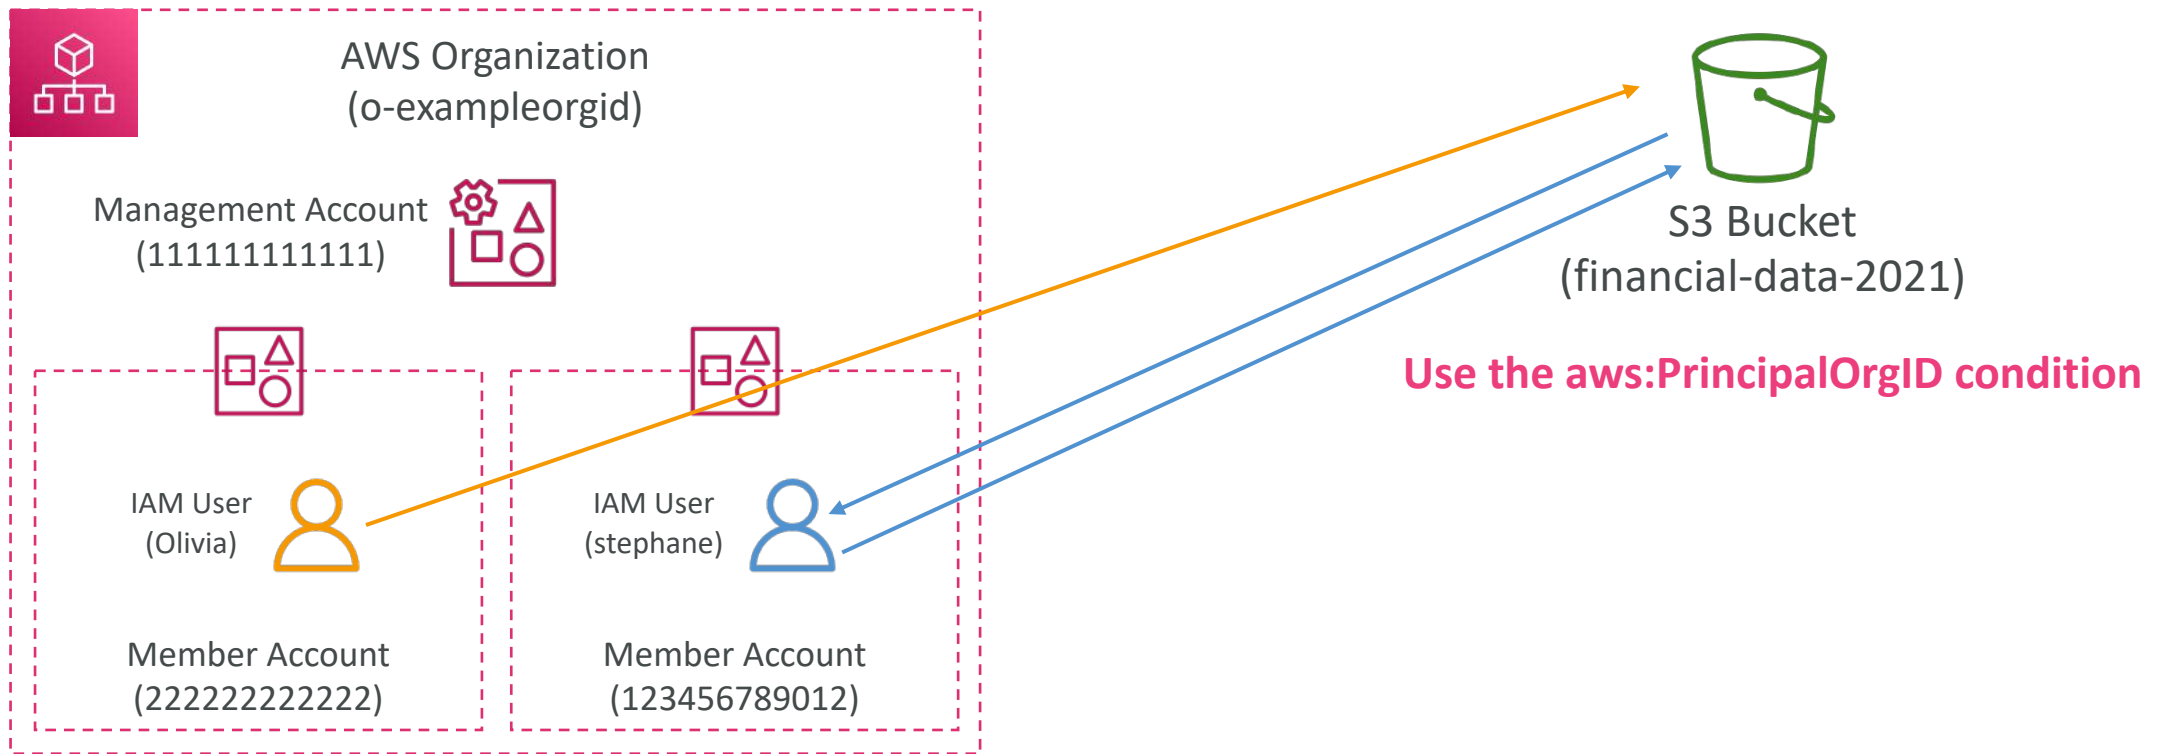

AWS Organizations – Tag Policies

- Helps you standardize tags across resources in an AWS Organization

- Ensure consistent tags, audit tagged resources, maintain proper resources categorization, …

- You define tag keys and their allowed values

- Helps with AWS Cost Allocation Tags and Attribute-based Access Control

- Prevent any non-compliant tagging operations on specified services and resources (has no effect on resources without tags)

- Generate a report that lists all tagged/non-compliant resources

- Use CloudWatch Events to monitor non-compliant tags

```
{
    "tags": {
        "costcenter": {
            "tag_key": {
                "@@assign": "CostCenter"
            },
            "tag_value": {
                "@@assign": ["100", "200"]
            },
            "enforced_for": {
                "@@assign": ["secretsmanager:*"]
            }
        }
    }
}
```

AWS Control Tower

- Easy way to **set up and govern a secure and compliant** <u>multi-account AWS environment</u> based on best practices

- Benefits:
  - Automate the set up of your environment in a few clicks
  - Automate ongoing policy management using guardrails
  - Detect policy violations and remediate them
  - Monitor compliance through an interactive dashboard

- AWS Control Tower runs on top of AWS Organizations:
  - It automatically sets up AWS Organizations to organize accounts and implement SCPs (Service Control Policies)

AWS Service Catalog

- Users that are new to AWS have too many options, and may create stacks that are not compliant / in line with the rest of the organization

- Some users just want a quick **self-service portal** to launch a set of **authorized products** pre-defined **by admins**

- Includes: virtual machines, databases, storage options, etc…

- Enter AWS Service Catalog!

Service Catalog diagram

ADMIN TASKS

Product

CloudFormation
Templates

Collection of Products

Control

IAM Permissions to
Access Portfolios

USER TASKS

Product List

Authorized by IAM

launch

Provisioned Products

Ready to use
Properly Configured
Properly Tagged
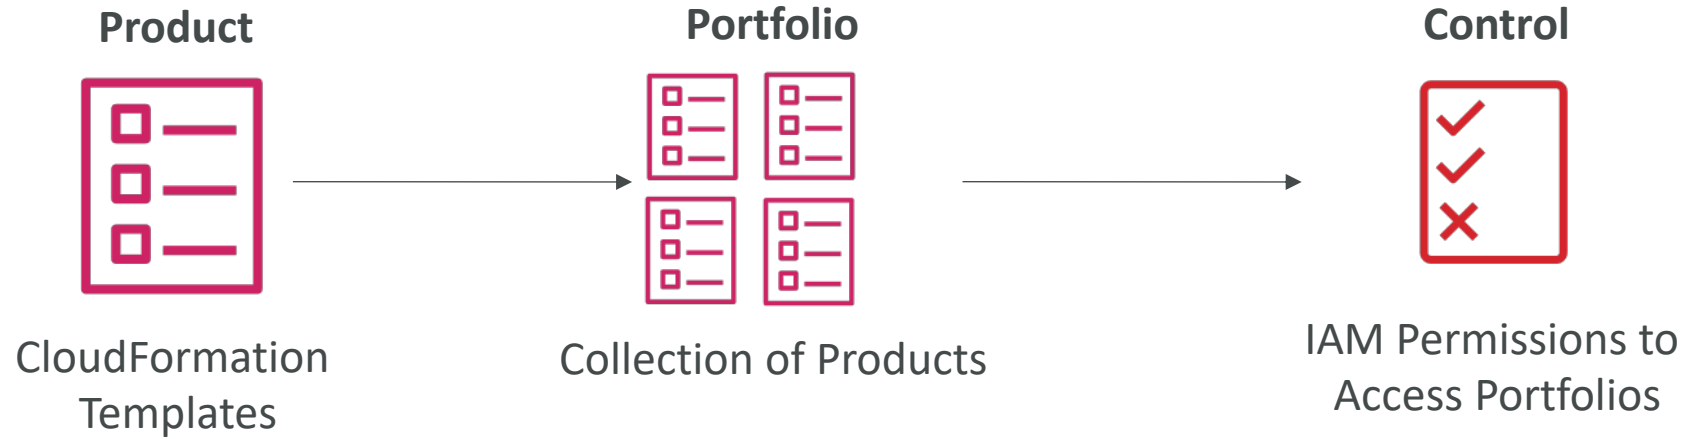

AWS Service Catalog – Sharing Catalogs

- Share portfolios with individual AWS accounts or AWS Organizations

- Sharing options:
  - Share a reference of the portfolio, then import the shared portfolio in the recipient account (stays in-sync with the original portfolio)
  - Deploy a copy of the portfolio into the recipient account (must re-deploy any updates)

- Ability to add products from the imported portfolio to the local portfolio
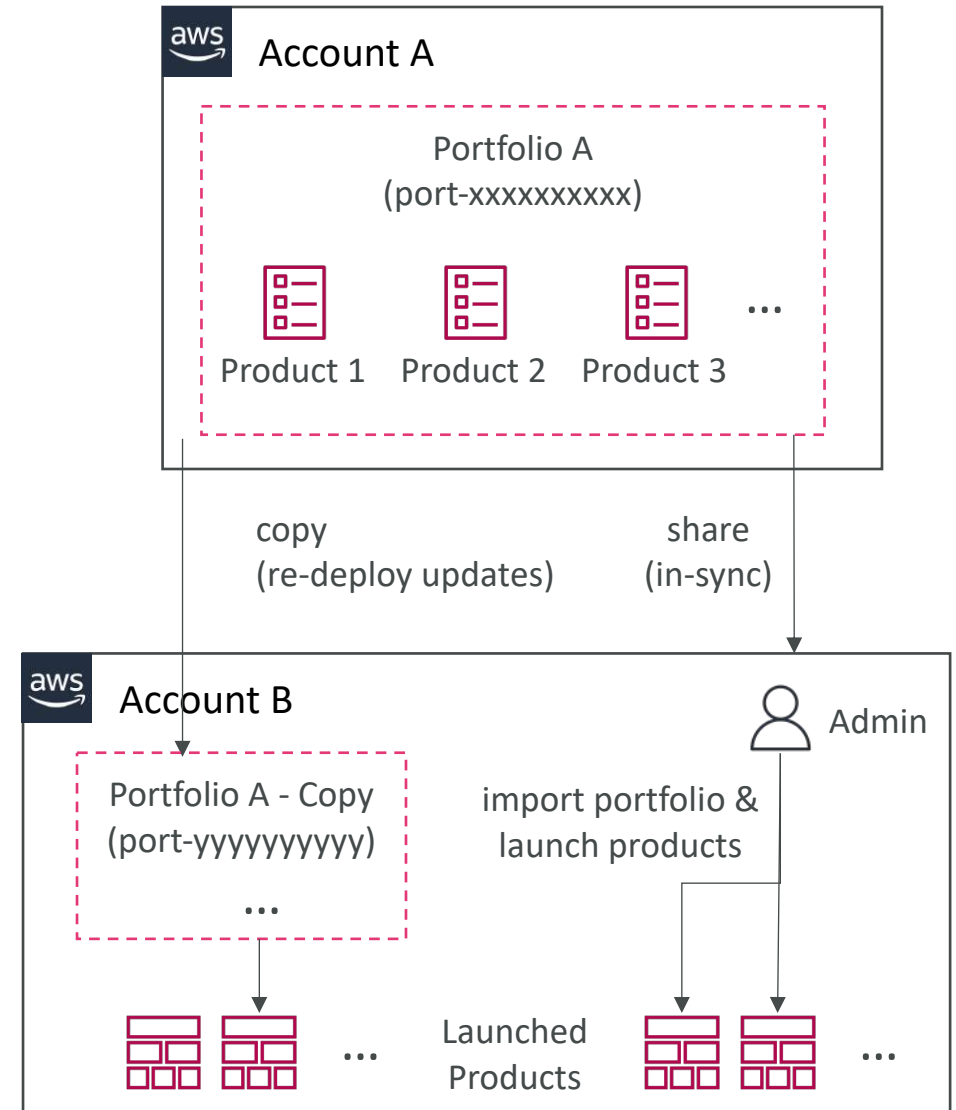

AWS Service Catalog – TagOptions Library

- Easily manage tags on provisioned products
- TagOption:
  - Key-value pair managed in AWS Service Catalog
  - Used to create an AWS Tag
- Can be associated with Portfolios and Products
- Use cases: proper resources tagging, defined allowed tags, …
- Can be shared with other AWS accounts and AWS Organizations
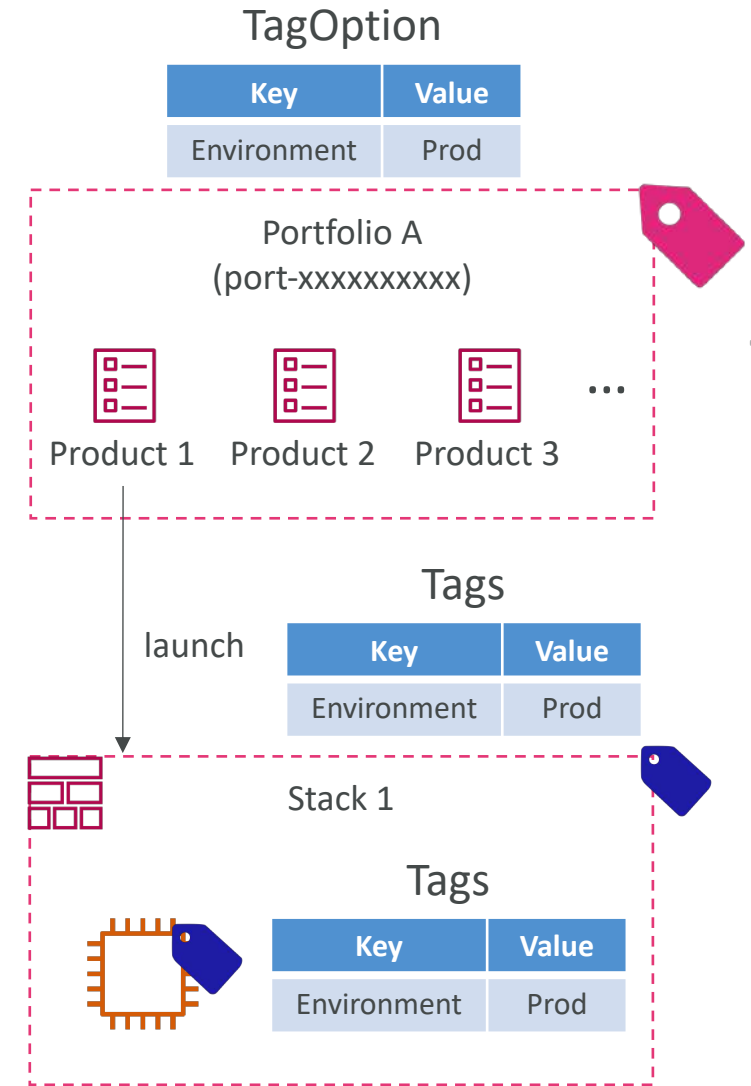

AWS Billing Alarms

- Billing data metric is stored in CloudWatch us-east-1
- Billing data are for overall **worldwide** AWS costs
- It's for actual cost, not for project costs

- Let's create a billing alarm together!

Cost Explorer

- Visualize, understand, and manage your AWS costs and usage over time

- Create custom reports that analyze cost and usage data.

- Analyze your data at a high level: total costs and usage across all accounts

- Or Monthly, hourly, resource level granularity

- Choose an optimal **Savings Plan** (to lower prices on your bill)

- **Forecast usage up to 12 months based on previous usage**

Cost Explorer – Monthly Cost by AWS Service

www.datacumulus.com

© Stephane Maarek

Cost Explorer– Hourly & Resource Level
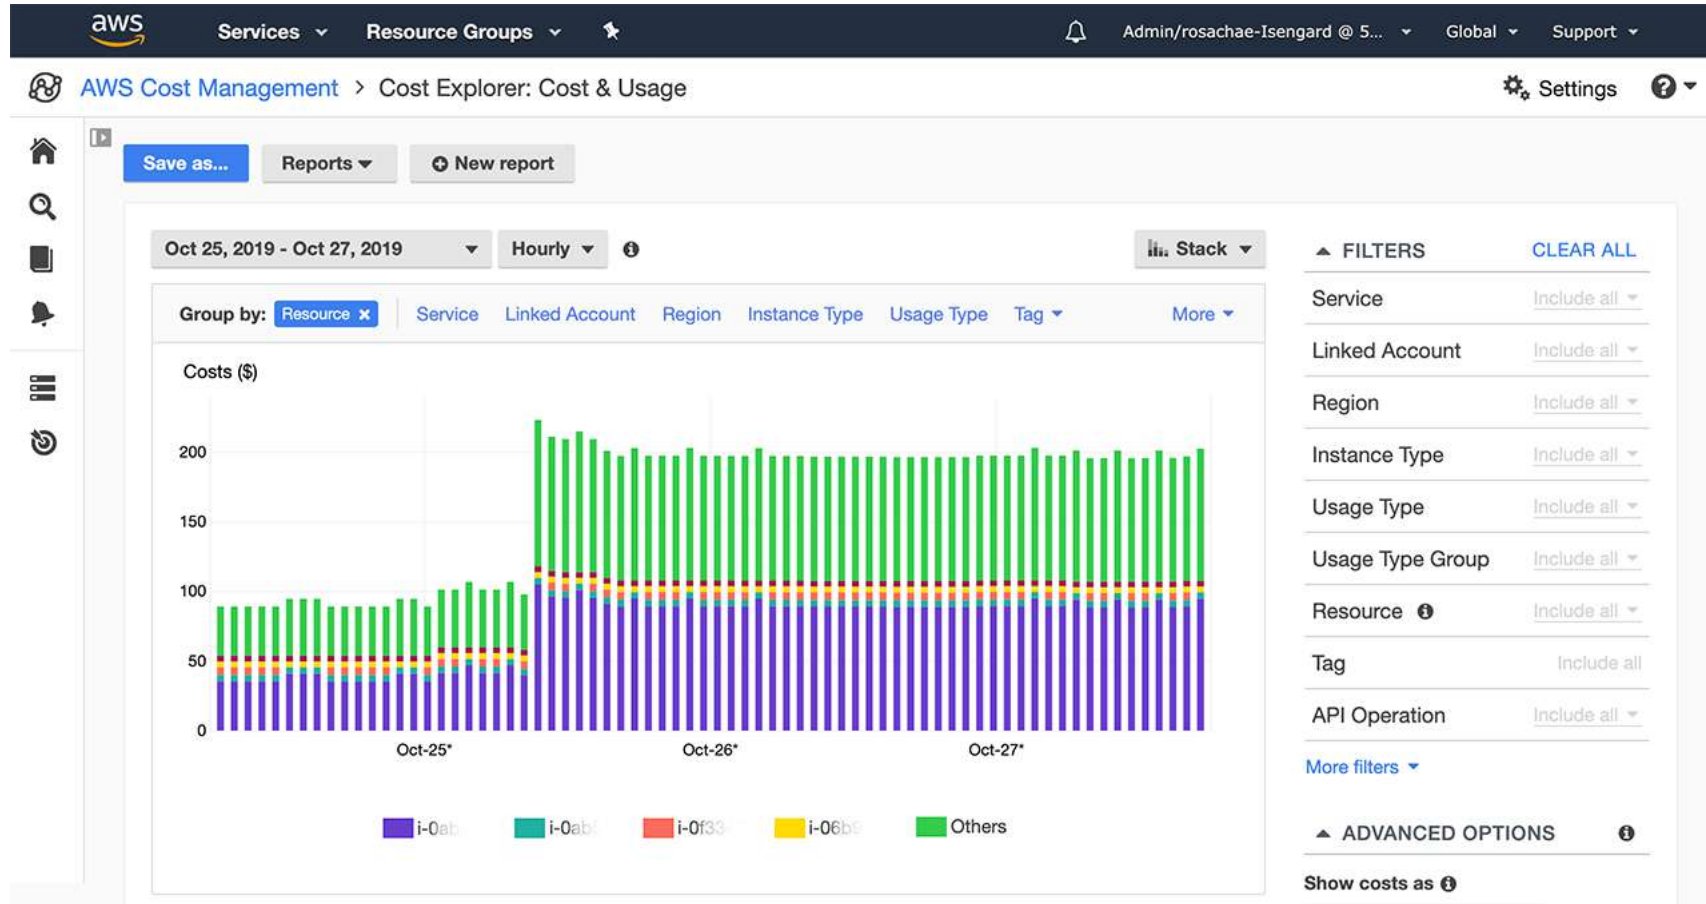

Cost Explorer – Savings Plan Alternative to Reserved Instances

Cost Explorer – Forecast Usage

AWS Budgets

- Create budget and **send alarms when costs exceeds the budget**

- 4 types of budgets: Usage, Cost, Reservation, Savings Plans

- For Reserved Instances (RI)
  - Track utilization
  - Supports EC2, ElastiCache, RDS, Redshift

- Up to 5 SNS notifications per budget

- Can filter by: Service, Linked Account, Tag, Purchase Option, Instance Type, Region, Availability Zone, API Operation, etc...

- Same options as AWS Cost Explorer!

- 2 budgets are free, then $0.02/day/budget

Cost Allocation Tags

- Use **cost allocation tags** to track your AWS costs on a detailed level

- AWS generated tags
  - Automatically applied to the resource you create
  - Starts with Prefix **aws:**   (e.g. aws: createdBy)

- User-defined tags
  - Defined by the user
  - Starts with Prefix **user:**

Total Cost	user:Owner	user:Stack	user:Cost Center	user:Application
0.95	DbAdmin	Test	80432	Widget2
0.01	DbAdmin	Test	80432	Widget2
3.84	DbAdmin	Prod	80432	Widget2
6.00	DbAdmin	Test	78925	Widget1
234.63	SysEng	Prod	78925	Widget1
0.73	DbAdmin	Test	78925	Widget1
0.00	DbAdmin	Prod	80432	Portal
2.47	DbAdmin	Prod	78925	Portal

Cost and Usage Reports

- Dive deeper into your AWS costs and usage
- The AWS Cost & Usage Report contains **the most comprehensive set of AWS cost and usage data available**
- Includes additional metadata about AWS services, pricing, and reservations **(e.g., Amazon EC2 Reserved Instances (RIs))**

- The AWS Cost & Usage Report lists AWS usage for each:
  - service category used by an account
  - in hourly or daily line items
  - any tags that you have activated for cost allocation purposes
- Can be configured for daily exports to S3
- Can be integrated with Athena, Redshift or QuickSight

daily

AWS Cost & Usage Report

report

CSV

S3 Bucket
AWS Compute Optimizer

- **Reduce costs** and **improve performance by** recommending optimal AWS resources for your workloads

- Helps you choose optimal configurations and right-size your workloads (over/under provisioned)

- Uses Machine Learning to analyze your **resources' configurations** and their **utilization CloudWatch metrics**

- Supported resources
  - EC2 instances
  - EC2 Auto Scaling Groups
  - EBS volumes
  - Lambda functions

- Lower your costs by up to 25%

- Recommendations can be exported to S3

Cost and Usage Reports

Disaster Recovery

AWS DataSync

- Move large amount of data to and from
  - On-premises / other cloud to AWS (NFS, SMB, HDFS, S3 API…) – **needs agent**
  - AWS to AWS (different storage services) – no agent needed

- Can synchronize to:
  - Amazon S3 (any storage classes – including Glacier)
  - Amazon EFS
  - Amazon FSx (Windows, Lustre, NetApp, OpenZFS...)

- Replication tasks can be scheduled hourly, daily, weekly

- **File permissions and metadata are preserved** (NFS POSIX, SMB…)

- One agent task can use 10 Gbps, can setup a bandwidth limit

AWS DataSync
NFS / SMB to AWS (S3, EFS, FSx…)
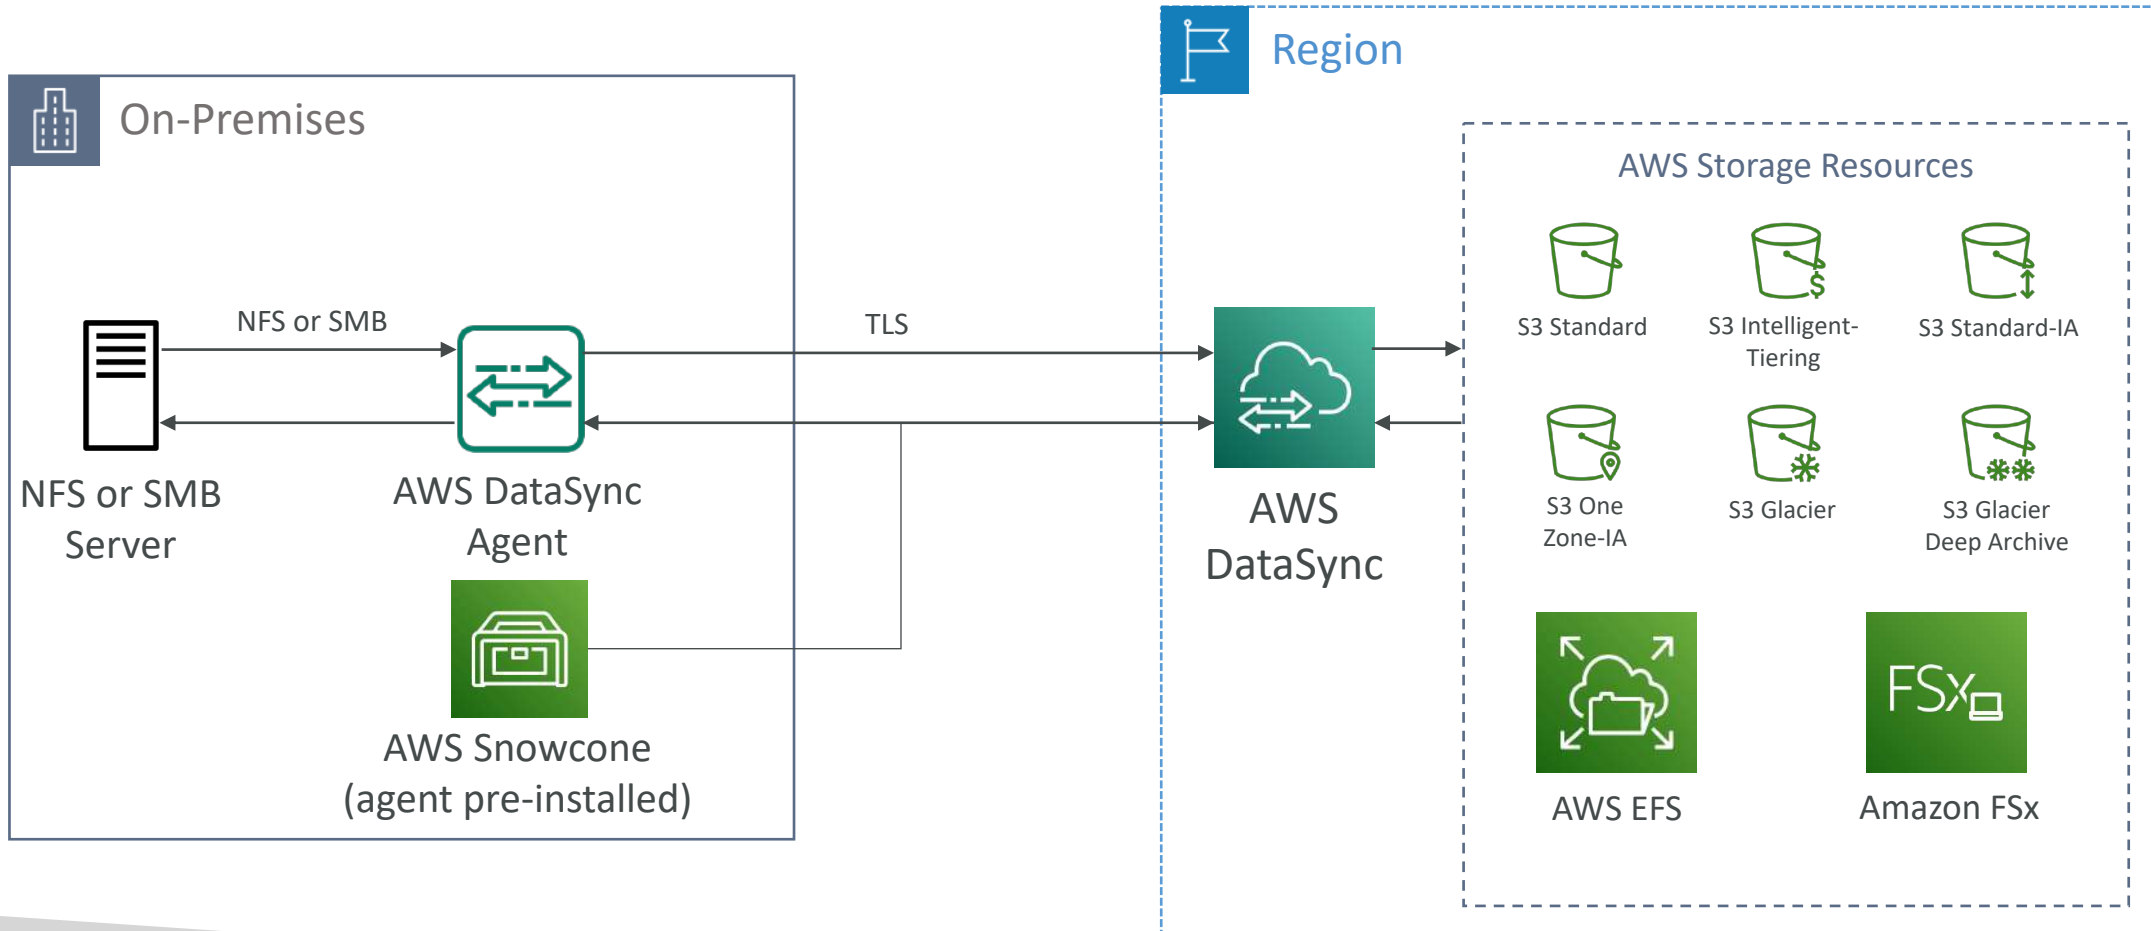

AWS DataSync
Transfer between AWS storage services

Amazon S3

Amazon EFS

Amazon FSx

AWS DataSync
copy data and metadata
between AWS Storage Services

Amazon S3

Amazon EFS

Amazon FSx
AWS Backup

- Fully managed service
- Centrally manage and automate backups across AWS services
- No need to create custom scripts and manual processes
- Supported services:
  - Amazon EC2 / Amazon EBS
  - Amazon S3
  - Amazon RDS (all DBs engines) / Amazon Aurora / Amazon DynamoDB
  - Amazon DocumentDB / Amazon Neptune
  - Amazon EFS / Amazon FSx (Lustre & Windows File Server)
  - AWS Storage Gateway (Volume Gateway)
- Supports cross-region backups
- Supports cross-account backups

AWS Backup

- Supports PITR for supported services

- On-Demand and Scheduled backups

- Tag-based backup policies

- You create backup policies known as **Backup Plans**
    - Backup frequency (every 12 hours, daily, weekly, monthly, cron expression)
    - Backup window
    - Transition to Cold Storage (Never, Days, Weeks, Months, Years)
    - Retention Period (Always, Days, Weeks, Months, Years)

AWS Backup
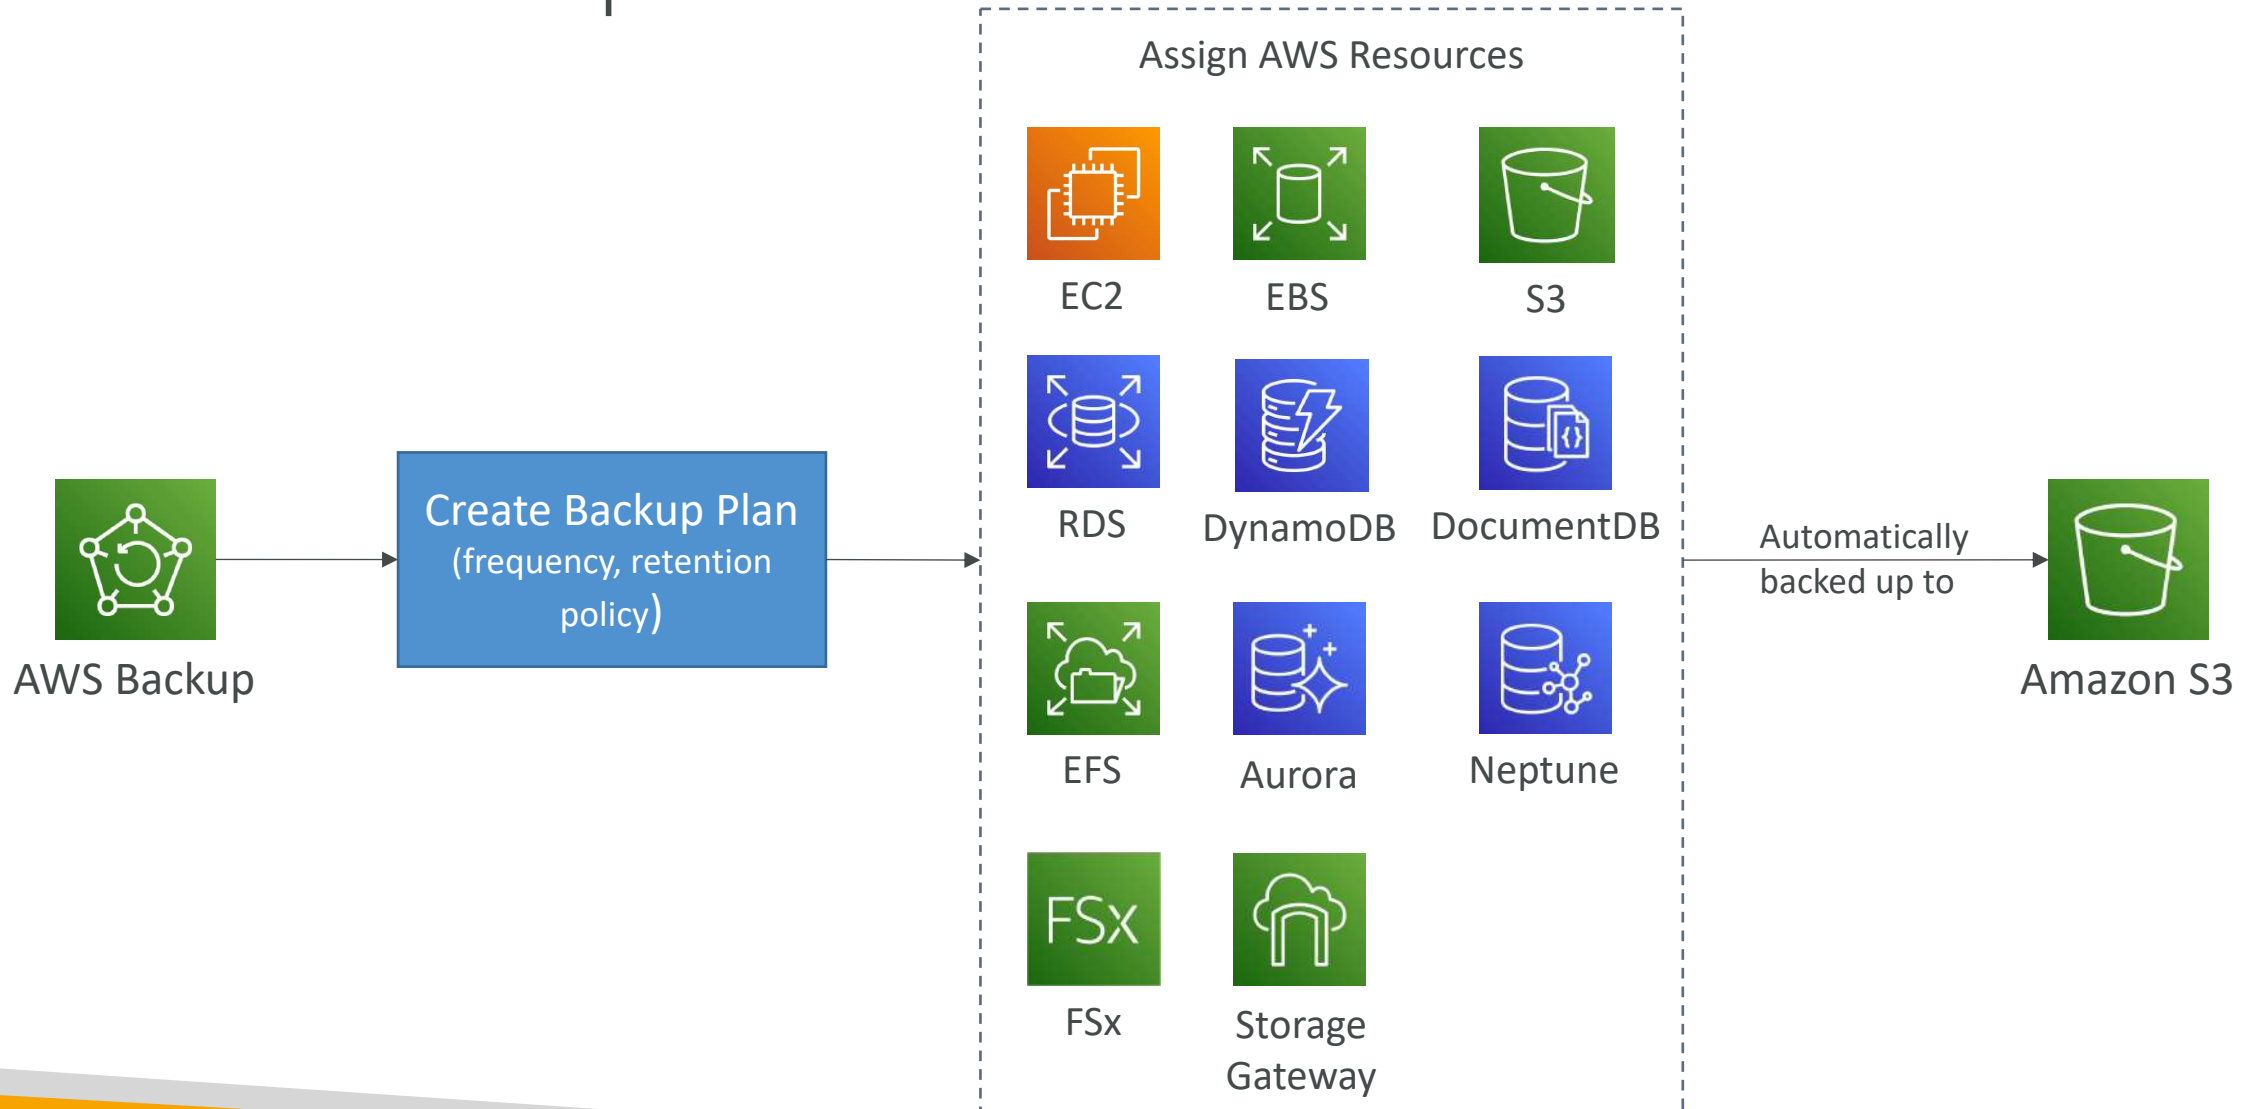

AWS Backup Vault Lock

- Enforce a WORM (Write Once Read Many) state for all the backups that you store in your AWS Backup Vault

- Additional layer of defense to protect your backups against:
  - Inadvertent or malicious delete operations
  - Updates that shorten or alter retention periods

- Even the root user cannot delete backups when enabled

backup

Backup Vault Lock Policy
Backups can't be deleted
Security & Compliance

AWS Shared Responsibility Model

- AWS responsibility - Security **of** the Cloud
  - Protecting infrastructure (hardware, software, facilities, and networking) that runs all the AWS services
  - Managed services like S3, DynamoDB, RDS, etc.

- Customer responsibility - Security **in** the Cloud
  - For EC2 instance, customer is responsible for management of the guest OS (including security patches and updates), firewall & network configuration, IAM
  - Encrypting application data

- Shared controls:
  - Patch Management, Configuration Management, Awareness & Training

Example, for RDS

- AWS responsibility:
  - Manage the underlying EC2 instance, disable SSH access
  - Automated DB patching
  - Automated OS patching
  - Audit the underlying instance and disks & guarantee it functions

- Your responsibility:
  - Check the ports / IP / security group inbound rules in DB's SG
  - In-database user creation and permissions
  - Creating a database with or without public access
  - Ensure parameter groups or DB is configured to only allow SSL connections
  - Database encryption setting

Example, for S3

- AWS responsibility:
  - Guarantee you get unlimited storage
  - Guarantee you get encryption
  - Ensure separation of the data between different customers
  - Ensure AWS employees can't access your data

- Your responsibility:
  - Bucket configuration
  - Bucket policy / public setting
  - IAM user and roles
  - Enabling encryption

DDoS Protection on AWS

- **AWS Shield Standard:** protects against DDoS attack for your website and applications, for all customers at no additional costs

- **AWS Shield Advanced:** 24/7 premium DDoS protection

- **AWS WAF:** Filter specific requests based on rules

- **CloudFront and Route 53:**
  - Availability protection using global edge network
  - Combined with AWS Shield, provides attack mitigation at the edge

- Be ready to scale – leverage AWS Auto Scaling

Sample Reference Architecture

https://aws.amazon.com/answers/networking/aws-ddos-attack-mitigation/
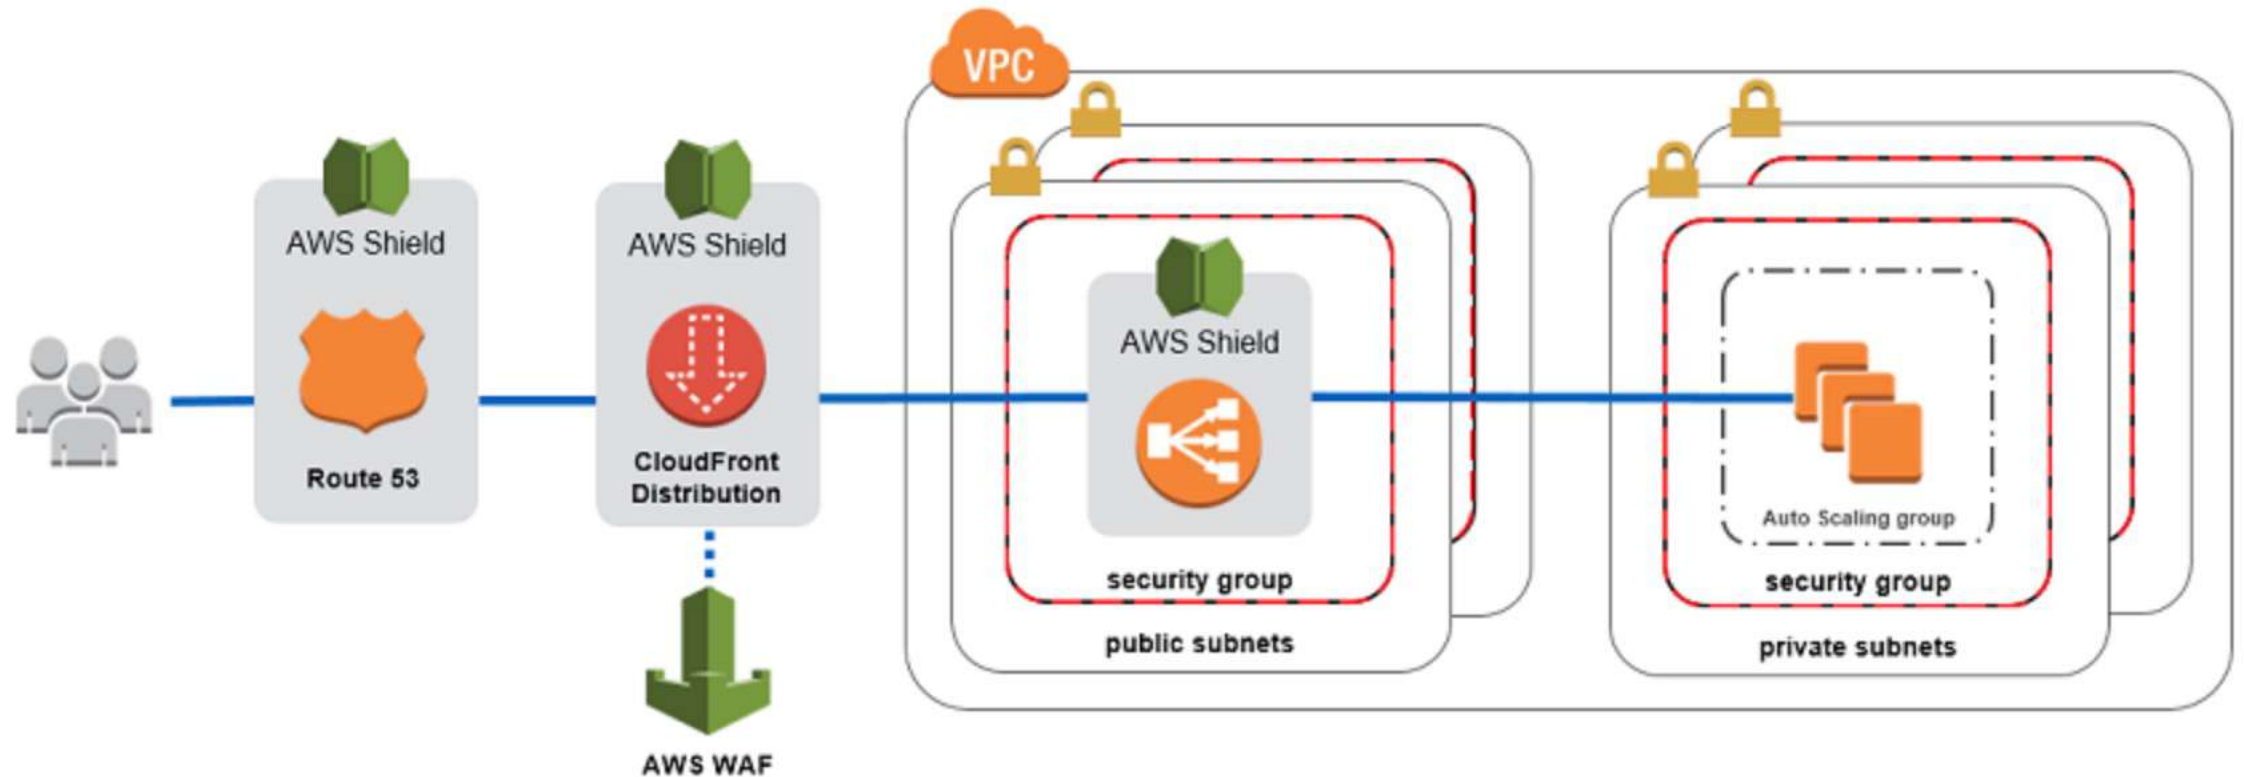

AWS Shield

- AWS Shield Standard:
  - Free service that is activated for every AWS customer
  - Provides protection from attacks such as SYN/UDP Floods, Reflection attacks and other layer 3/layer 4 attacks

- AWS Shield Advanced:
  - Optional DDoS mitigation service ($3,000 per month per organization)
  - Protect against more sophisticated attack on Amazon EC2, Elastic Load Balancing (ELB), Amazon CloudFront, AWS Global Accelerator, and Route 53
  - 24/7 access to AWS DDoS response team (DRP)
  - Protect against higher fees during usage spikes due to DDoS

AWS WAF – Web Application Firewall

- Protects your web applications from common web exploits (Layer 7)
- **Layer 7 is HTTP** (vs Layer 4 is TCP)
- Deploy on **Application Load Balancer**, API Gateway, CloudFront

- Define Web ACL (Web Access Control List):
  - Rules can include: **IP addresses,** HTTP headers, HTTP body, or URI strings
  - Protects from common attack - **SQL injection** and **Cross-Site Scripting (XSS)**
  - Size constraints, **geo-match (block countries)**
  - **Rate-based rules** (to count occurrences of events) – **for DDoS protection**

Penetration Testing on AWS Cloud

- AWS customers are welcome to carry out security assessments or penetration tests against their AWS infrastructure **without prior approval for 8 services**:
  - Amazon EC2 instances, NAT Gateways, and Elastic Load Balancers
  - Amazon RDS
  - Amazon CloudFront
  - Amazon Aurora
  - Amazon API Gateways
  - AWS Lambda and Lambda Edge functions
  - Amazon Lightsail resources
  - Amazon Elastic Beanstalk environments

- List can increase over time (you won't be tested on that at the exam)

Penetration Testing on your AWS Cloud

- Prohibited Activities
  - DNS zone walking via Amazon Route 53 Hosted Zones
  - Denial of Service (DoS), Distributed Denial of Service (DDoS), Simulated DoS, Simulated DDoS
  - Port flooding
  - Protocol flooding
  - Request flooding (login request flooding, API request flooding)
- For any other simulated events, contact aws-security-simulated-event@amazon.com
- Read more: https://aws.amazon.com/security/penetration-testing/

Amazon Inspector

- Automated Security Assessments

- For EC2 instances
  - Leveraging the AWS System Manager (SSM) agent
  - Analyze against **unintended network accessibility**
  - Analyze the **running OS** against **known vulnerabilities**
- For Container Images push to Amazon ECR
  - Assessment of Container Images as they are pushed
- For Lambda Functions
  - Identifies software vulnerabilities in function code and package dependencies
  - Assessment of functions as they are deployed

- Reporting & integration with AWS Security Hub
- Send findings to Amazon Event Bridge

Lambda Function

SSM Agent

Amazon Inspector

Amazon ECR Container Image

assessment run state & findings

Security Hub

EventBridge
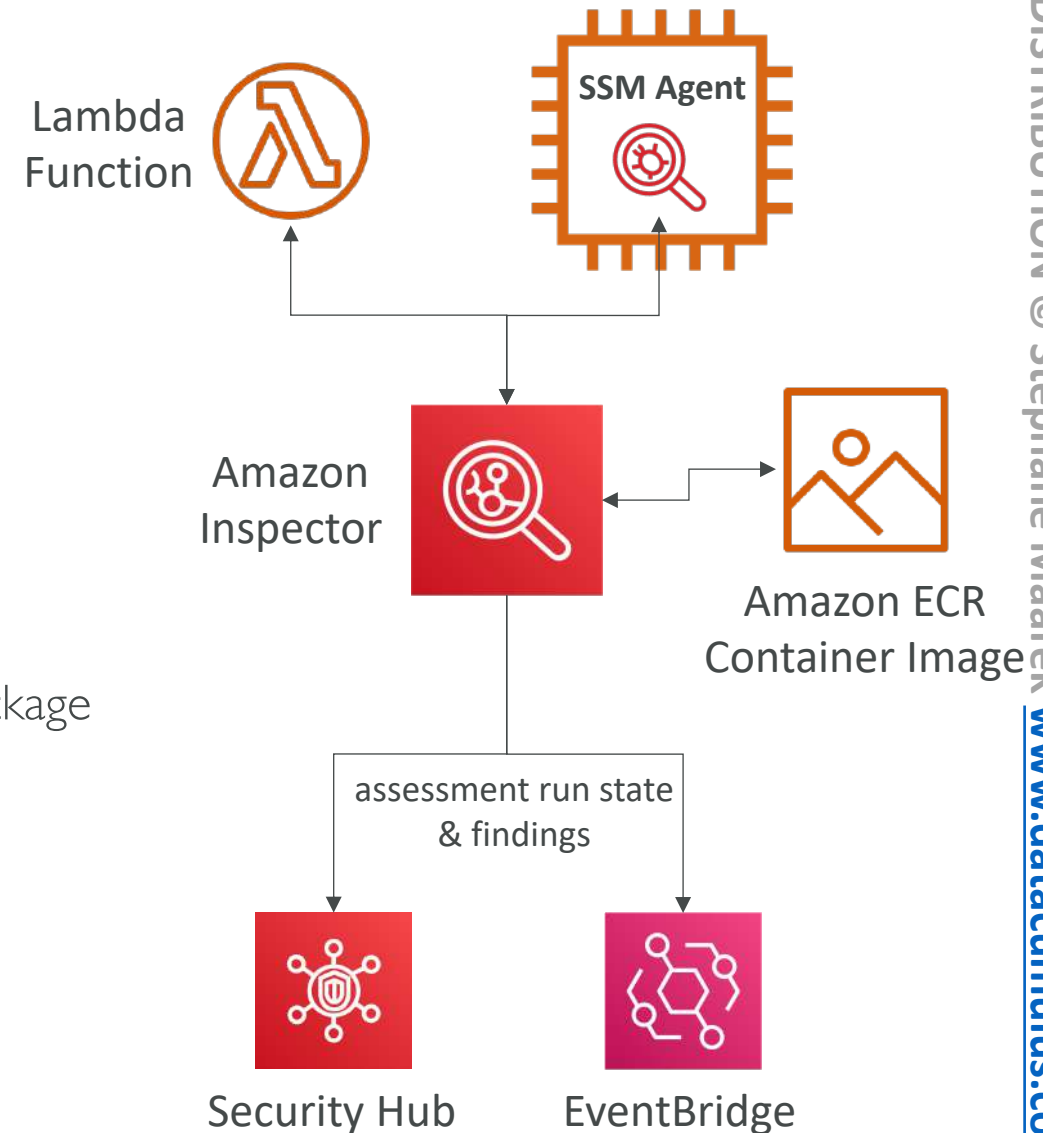

What does Amazon Inspector evaluate?

- Remember: only for EC2 instances, Container Images & Lambda functions

- Continuous scanning of the infrastructure, only when needed

- Package vulnerabilities (EC2, ECR & Lambda) – database of CVE
- Network reachability (EC2)

- A risk score is associated with all vulnerabilities for prioritization

Logging in AWS for security and compliance

- To help compliance requirements, AWS provides many service-specific security and audit logs
- Service Logs include:
  - CloudTrail trails - trace all API calls
  - Config Rules - for config & compliance over time
  - CloudWatch Logs - for full data retention
  - VPC Flow Logs - IP traffic within your VPC
  - ELB Access Logs - metadata of requests made to your load balancers
  - CloudFront Logs - web distribution access logs
  - WAF Logs - full logging of all requests analyzed by the service
- Logs can be analyzed using AWS Athena if they're stored in S3
- You should encrypt logs in S3, control access using IAM & Bucket Policies, MFA
- Move Logs to Glacier for cost savings
- Read whitepaper if interested at:
  https://d0.awsstatic.com/whitepapers/compliance/AWS_Security_at_Scale_Logging_in_AWS_Whitepaper.pdf

Amazon GuardDuty

- Intelligent Threat discovery to protect your AWS Account
- Uses Machine Learning algorithms, anomaly detection, 3rd party data
- One click to enable (30 days trial), no need to install software
- Input data includes:
  - **CloudTrail Events Logs** – unusual API calls, unauthorized deployments
    - **CloudTrail Management Events** – create VPC subnet, create trail, …
    - **CloudTrail S3 Data Events** – get object, list objects, delete object, …
  - **VPC Flow Logs** – unusual internal traffic, unusual IP address
  - **DNS Logs** – compromised EC2 instances sending encoded data within DNS queries
  - **Optional Feature** – EKS Audit Logs, RDS & Aurora, EBS, Lambda, S3 Data Events…
- Can setup **EventBridge rules** to be notified in case of findings
- EventBridge rules can target AWS Lambda or SNS
- **Can protect against CryptoCurrency attacks (has a dedicated "finding" for it)**

Amazon GuardDuty
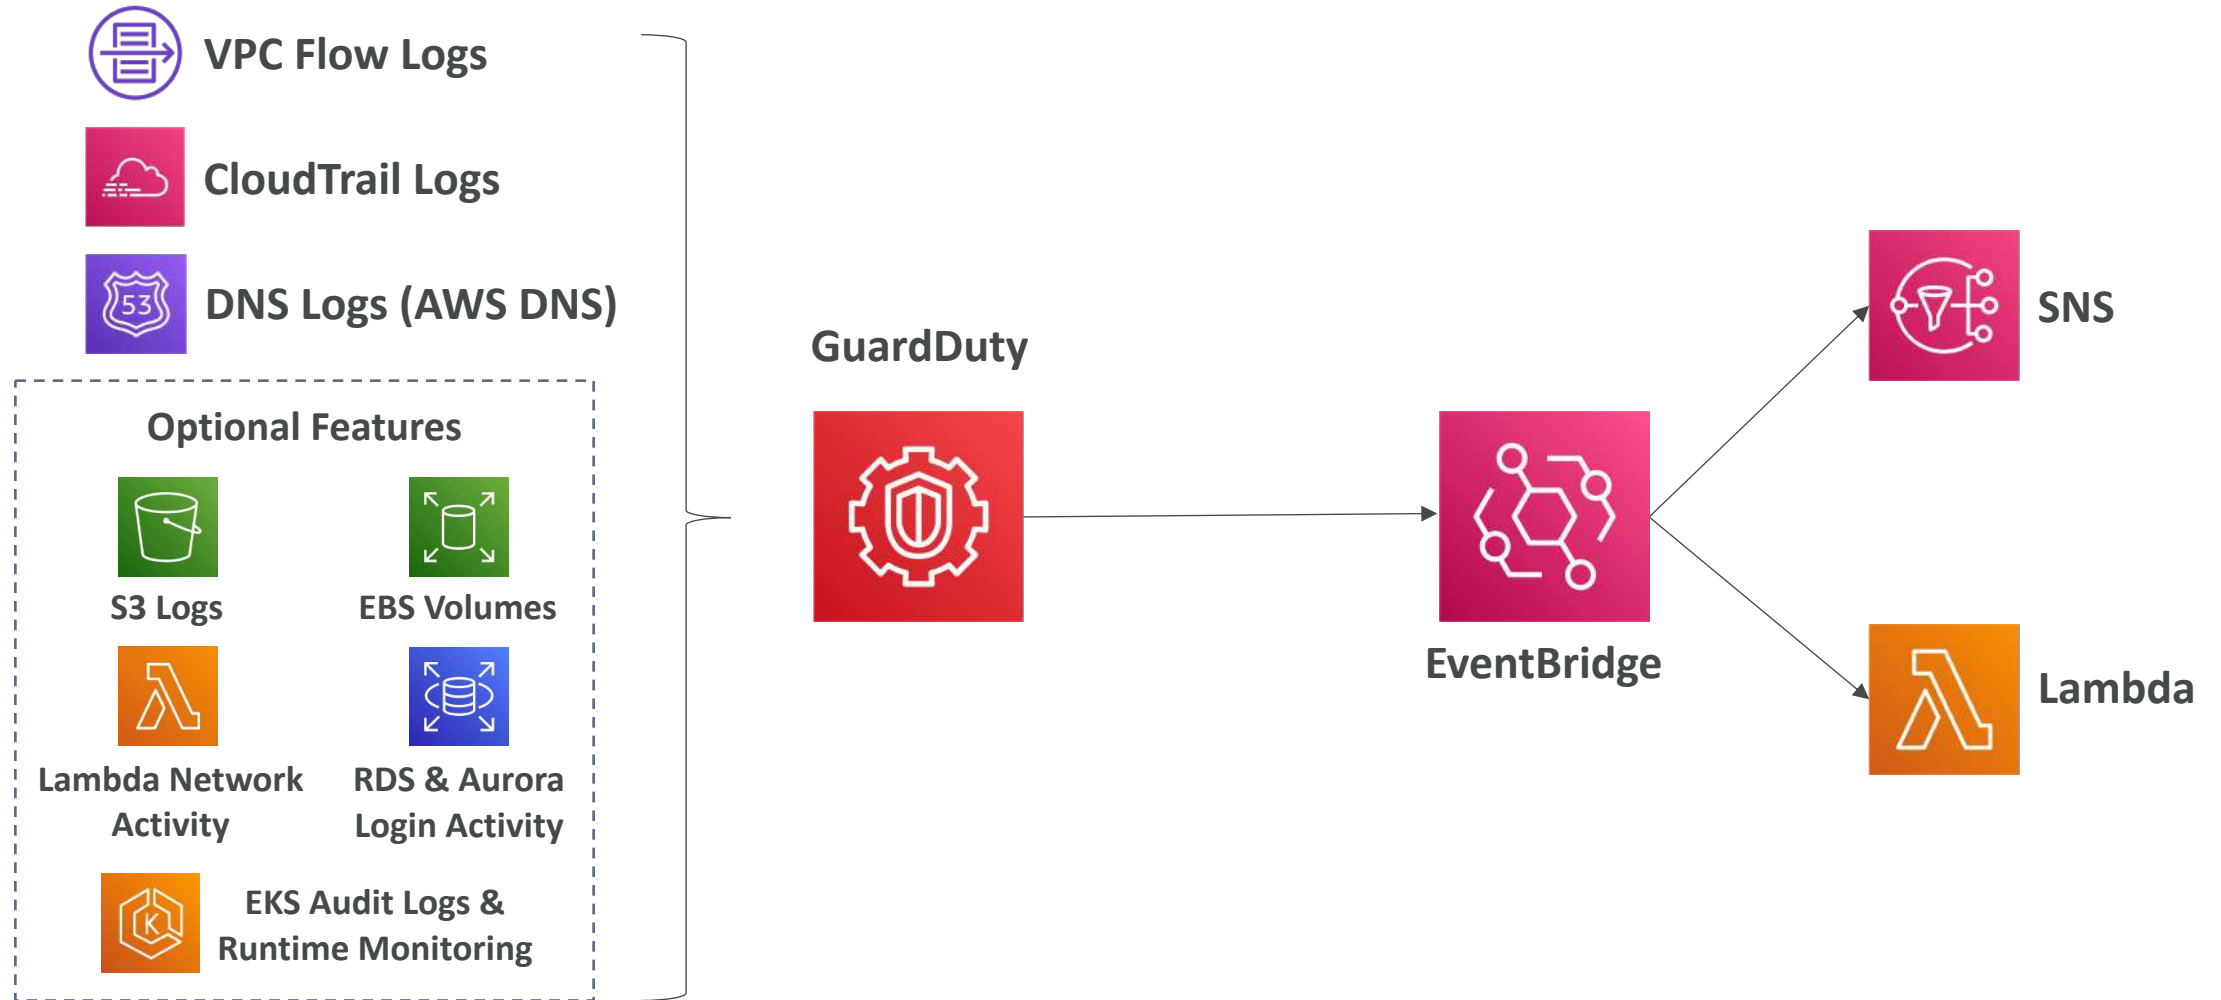

AWS Macie

- Amazon Macie is a fully managed data security and data privacy service that uses **machine learning and pattern matching to discover and protect your sensitive data in AWS.**

- Macie helps identify and alert you to **sensitive data, such as personally** identifiable information (PII)

S3 Buckets — analyze → **Macie** Discover Sensitive Data (PII) — notify → Amazon EventBridge — integrations →

Trusted Advisor

- No need to install anything – high level AWS account assessment
- Analyze your AWS accounts and provides recommendation on 6 categories:
  - Cost optimization
  - Performance
  - Security
  - Fault tolerance
  - Service limits
  - Operational Excellence
- <u>Business</u> & <u>Enterprise</u> Support plan
  - Full Set of Checks
  - Programmatic Access using <u>AWS Support API</u>

Checks

▶ ⊘ **Amazon EBS Public Snapshots**

Checks the permission settings for your Amazon Elastic

0 EBS snapshots are marked as public.

▶ ⊘ **Amazon RDS Public Snapshots**

Checks the permission settings for your Amazon Relation public.

0 RDS snapshots are marked as public.

▶ ⊘ **IAM Use**

This check is intended to discourage the use of root acce

At least one IAM user has been created for this account.

Why encryption?
Encryption in flight (TLS / SSL)

- Data is encrypted before sending and decrypted after receiving

- TLS certificates help with encryption (HTTPS)

- Encryption in flight ensures no MITM (man in the middle attack) can happen

Why encryption?
Server-side encryption at rest

- Data is encrypted after being received by the server

- Data is decrypted before being sent

- It is stored in an encrypted form thanks to a key (usually a data key)

- The encryption / decryption keys must be managed somewhere, and the server must have access to it
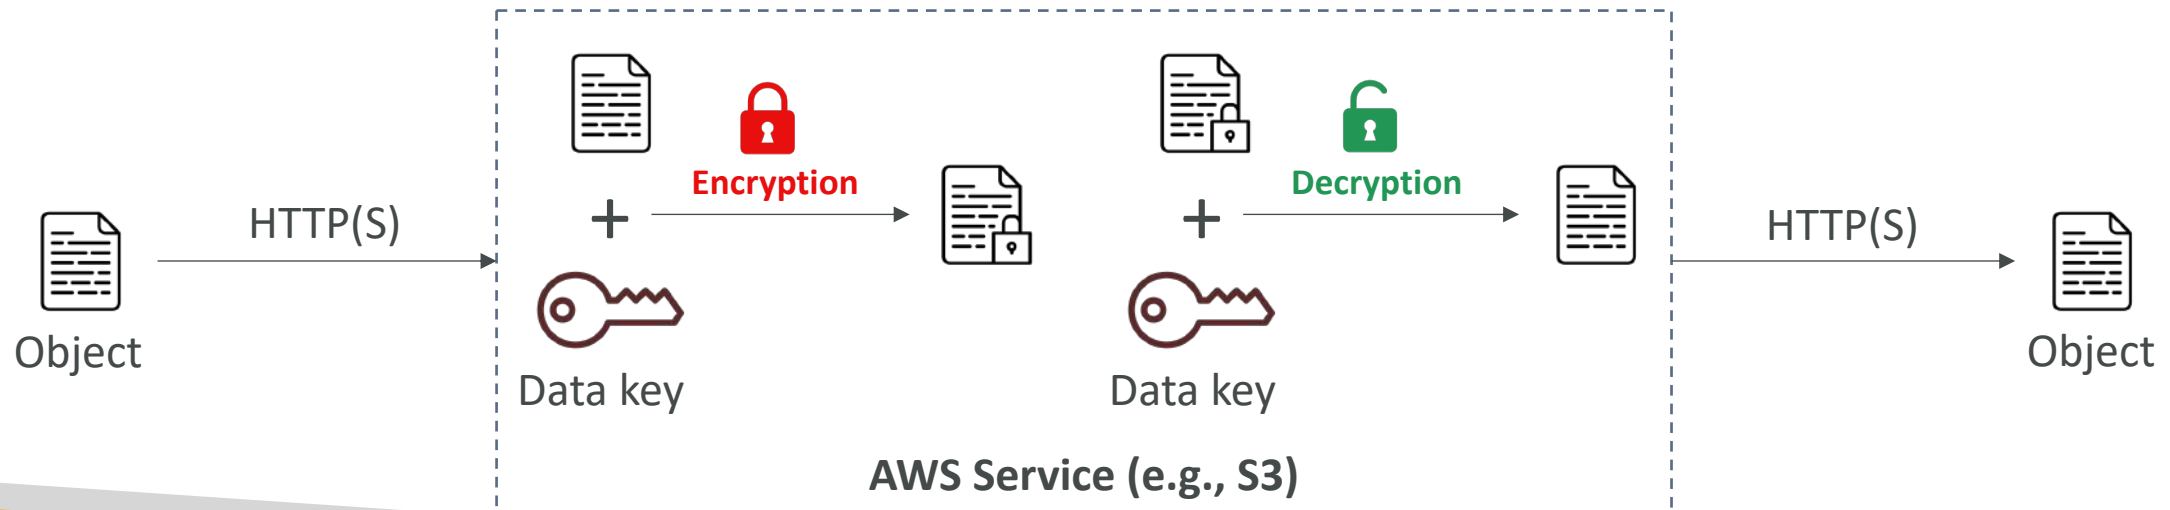

Why encryption?
Client-side encryption

- Data is encrypted by the client and never decrypted by the server
- Data will be decrypted by a receiving client
- The server should not be able to decrypt the data
- Could leverage Envelope Encryption
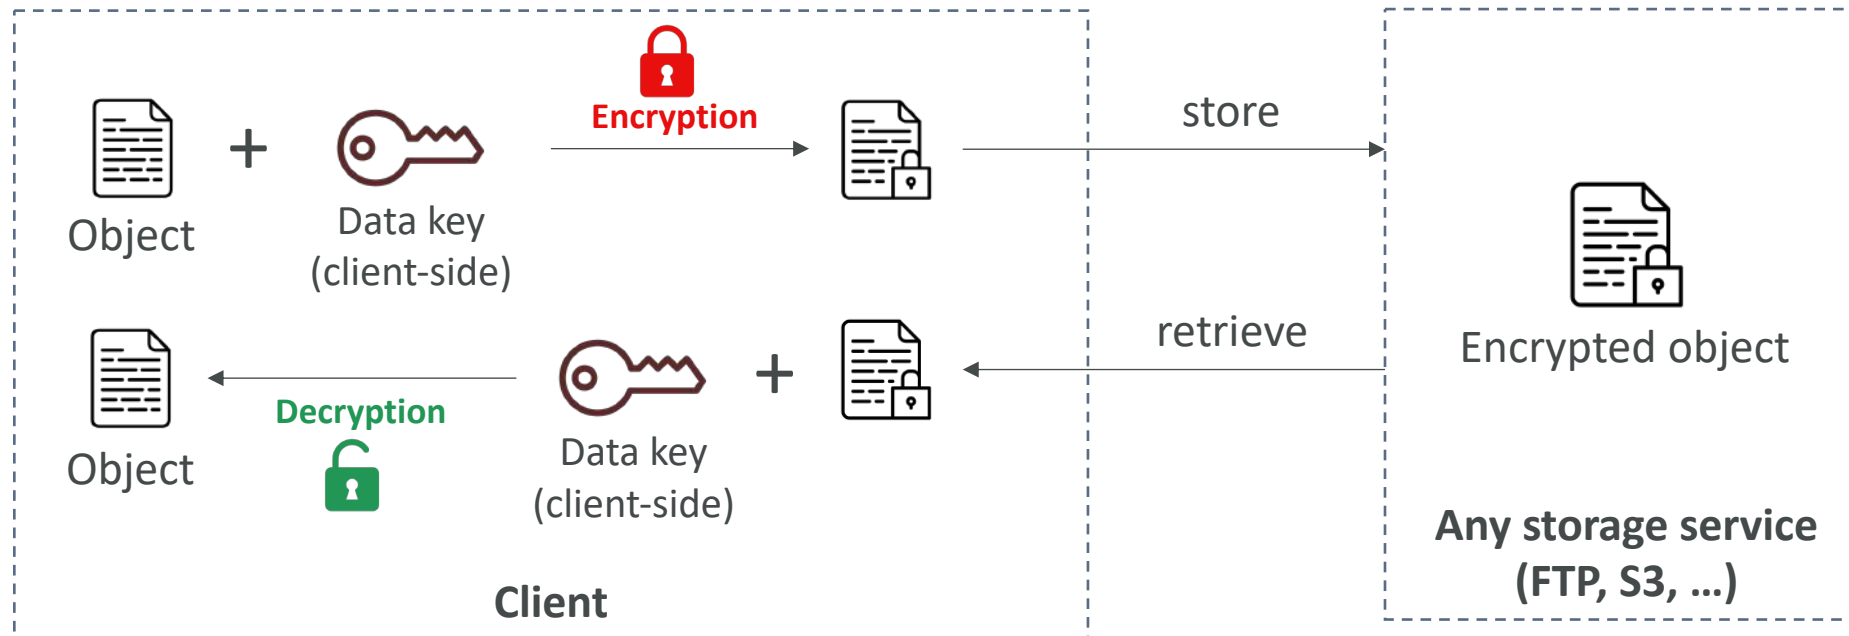

AWS KMS (Key Management Service)

- Anytime you hear "encryption" for an AWS service, it's most likely KMS
- AWS manages encryption keys for us
- Fully integrated with IAM for authorization
- Easy way to control access to your data
- Able to audit KMS Key usage using CloudTrail
- Seamlessly integrated into most AWS services (EBS, S3, RDS, SSM…)
- **Never ever store your secrets in plaintext, especially in your code!**
  - KMS Key Encryption also available through API calls (SDK, CLI)
  - Encrypted secrets can be stored in the code / environment variables

KMS Keys Types

- KMS Keys is the new name of KMS Customer *Master* Key

- Symmetric (AES-256 keys)
  - Single encryption key that is used to Encrypt and Decrypt
  - AWS services that are integrated with KMS use Symmetric CMKs
  - You never get access to the KMS Key unencrypted (must call KMS API to use)

- Asymmetric (RSA & ECC key pairs)
  - Public (Encrypt) and Private Key (Decrypt) pair
  - Used for Encrypt/Decrypt, or Sign/Verify operations
  - The public key is downloadable, but you can't access the Private Key unencrypted
  - Use case: encryption outside of AWS by users who can't call the KMS API

AWS KMS (Key Management Service)

- Types of KMS Keys:
  - AWS Owned Keys (free): SSE-S3, SSE-SQS, SSE-DDB (default key)
  - AWS Managed Key: **free** (aws/*service-name*, example: aws/rds or aws/ebs)
  - Customer managed keys created in KMS: **$1 / month**
  - Customer managed keys imported: **$1 / month**
  - + pay for API call to KMS ($0.03 / 10000 calls)

Encryption key management
- ● Owned by Amazon DynamoDB
- ○ AWS managed key Lea
  Key alias: aws/dynamodb.
- ○ Stored in your account,
  and owned and managed by you

- Automatic Key rotation:
  - AWS-managed KMS Key: automatic every 1 year
  - Customer-managed KMS Key: (must be enabled) automatic & on-demand
  - Imported KMS Key: only manual rotation possible using alias

Copying Snapshots across regions
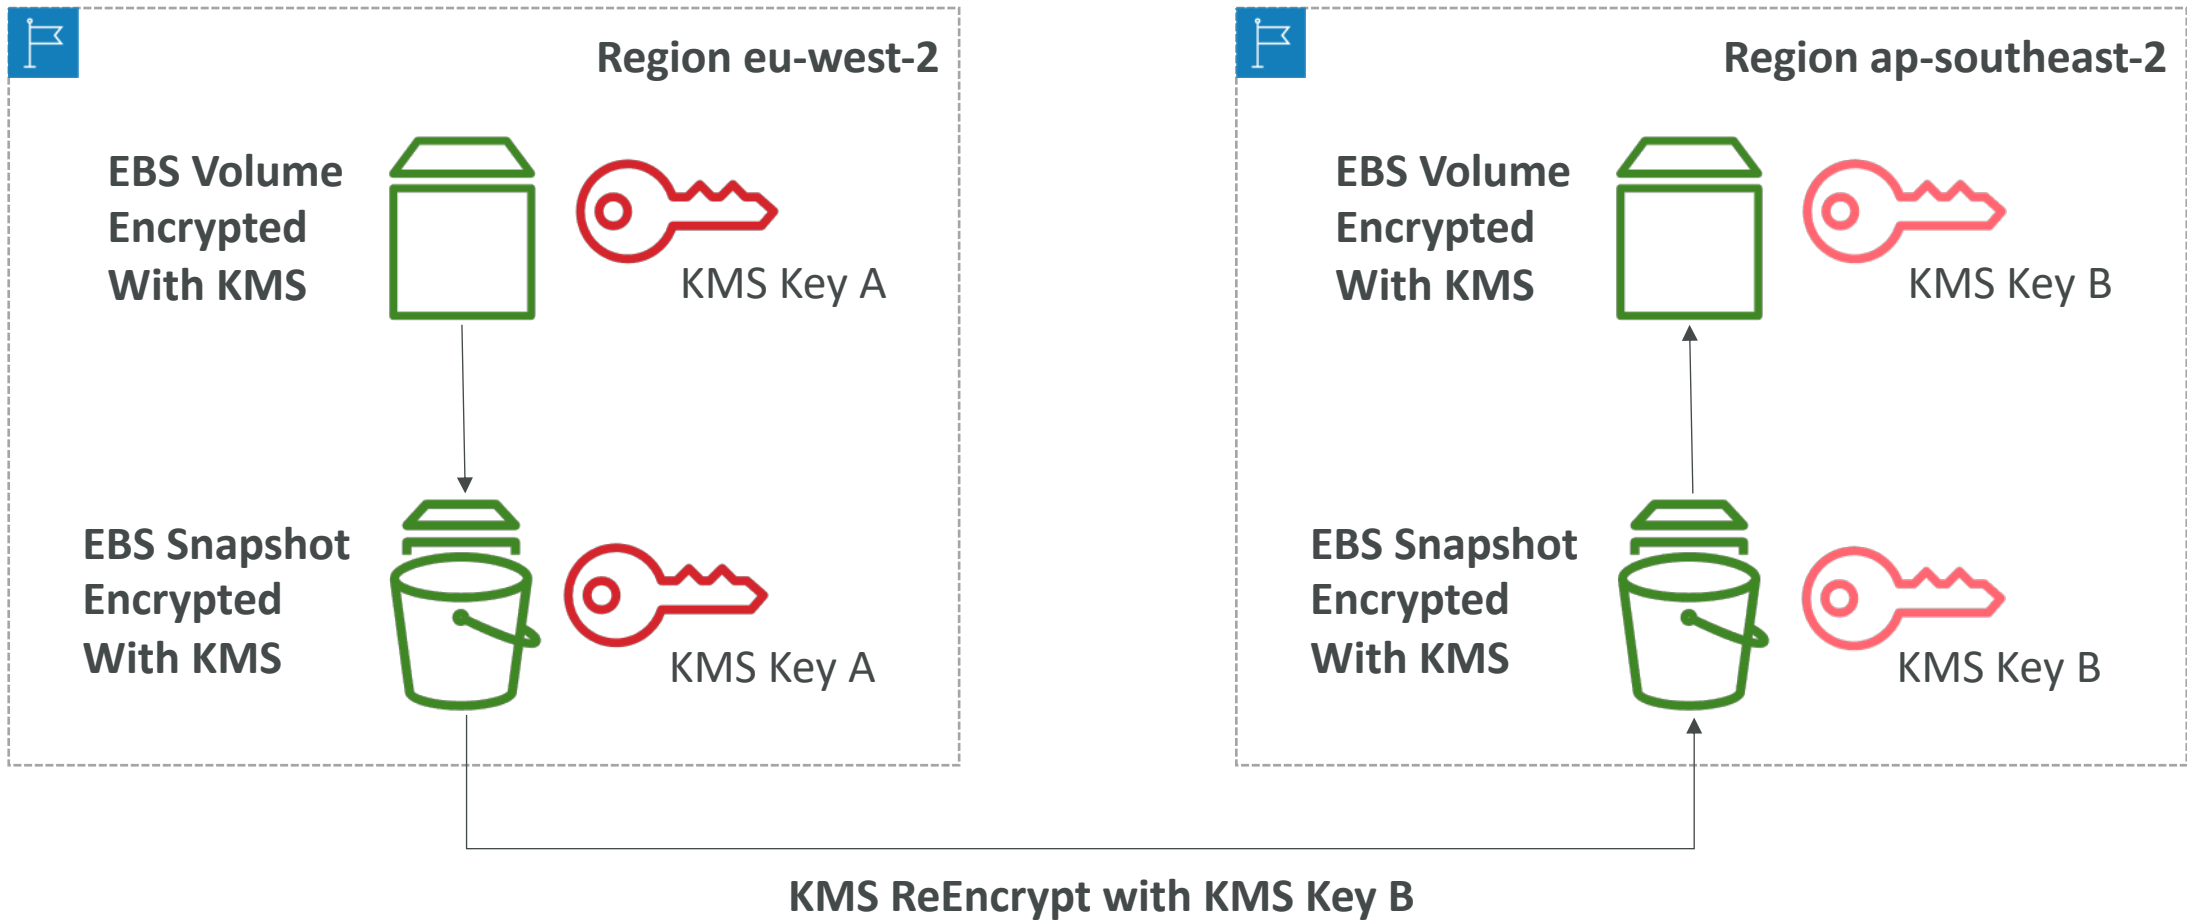

KMS Key Policies
- Control access to KMS keys, "similar" to S3 bucket policies
- Difference: you cannot control access without them

- Default KMS Key Policy:
  - Created if you don't provide a specific KMS Key Policy
  - Complete access to the key to the root user = entire AWS account
- Custom KMS Key Policy:
  - Define users, roles that can access the KMS key
  - Define who can administer the key
  - Useful for cross-account access of your KMS key

Copying Snapshots across accounts

1. Create a Snapshot, encrypted with your own KMS Key (Customer Managed Key)

2. **Attach a KMS Key Policy to authorize cross-account access**

3. Share the encrypted snapshot

4. (in target) Create a copy of the Snapshot, encrypt it with a CMK in your account

5. Create a volume from the snapshot

```
{
    "Sid": "Allow use of the key with destination account",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::TARGET-ACCOUNT-ID:role/ROLENAME"
    },
    "Action": [
        "kms:Decrypt",
        "kms:CreateGrant"
    ],
    "Resource": "*",
    "Condition": {
        "StringEquals": {
            "kms:ViaService": "ec2.REGION.amazonaws.com",
            "kms:CallerAccount": "TARGET-ACCOUNT-ID"
        }
    }
}
```

KMS Key Policy

KMS Automatic Key Rotation

- AWS-managed KMS Keys: automatically rotated every 1 year

- For Customer-Managed Symmetric KMS Key
    - Automatic key rotation is optionally enabled
    - **Customize Rotation Period** between 90 and 2560 days (default: 365 days)
    - Previous key is kept active so you can decrypt old data
    - New Key has the same KMS Key ID (only the backing key is changed)

Backing Key

111122223333

Automatic Key rotation

Backing Key

444455556666

Saved Backing Key

111122223333

KMS Key ID = 1234abcd-12ab-34cd-56ef-1234567890ab

KMS Key ID = 1234abcd-12ab-34cd-56ef-1234567890ab
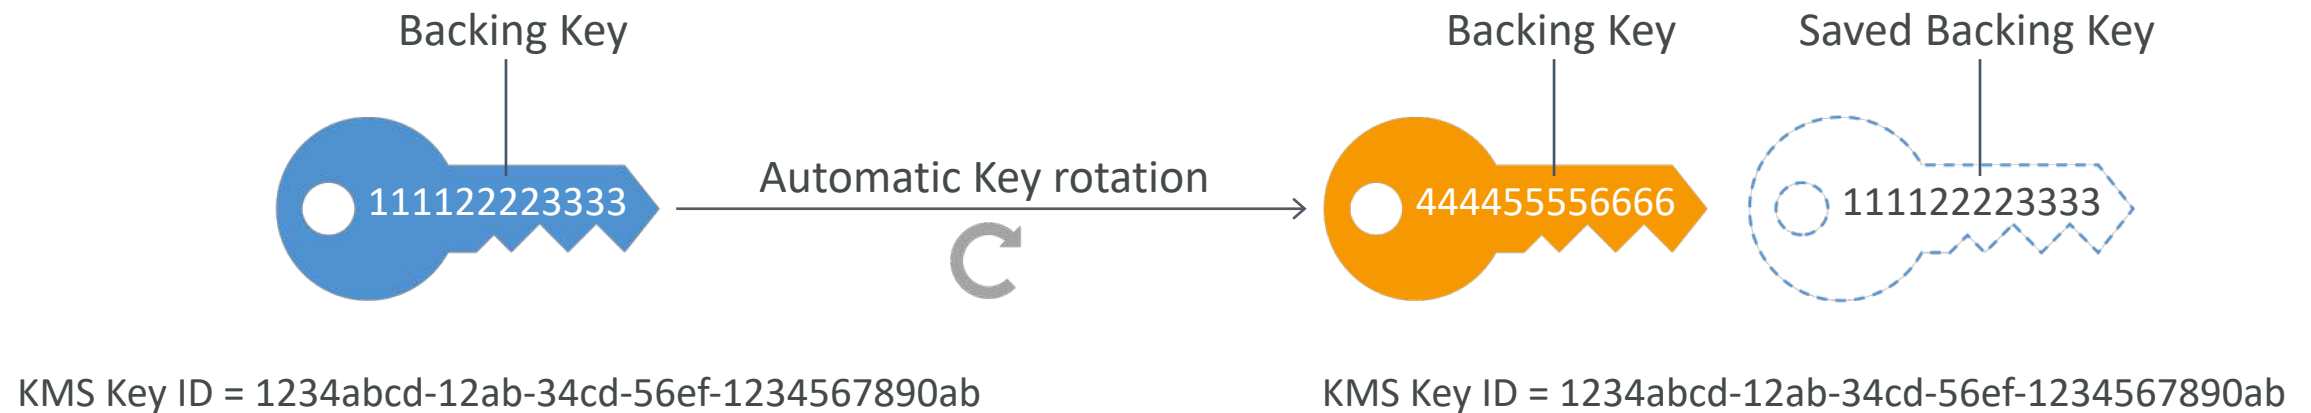

KMS On-Demand Key Rotation

- **For Customer-Managed Symmetric KMS Key** (not AWS managed CMK)
- Does NOT require Automatic Key Rotation to be enabled
- Does NOT change existing Automatic Rotation schedules
- Limit to how many times you can trigger an on-demand key rotation
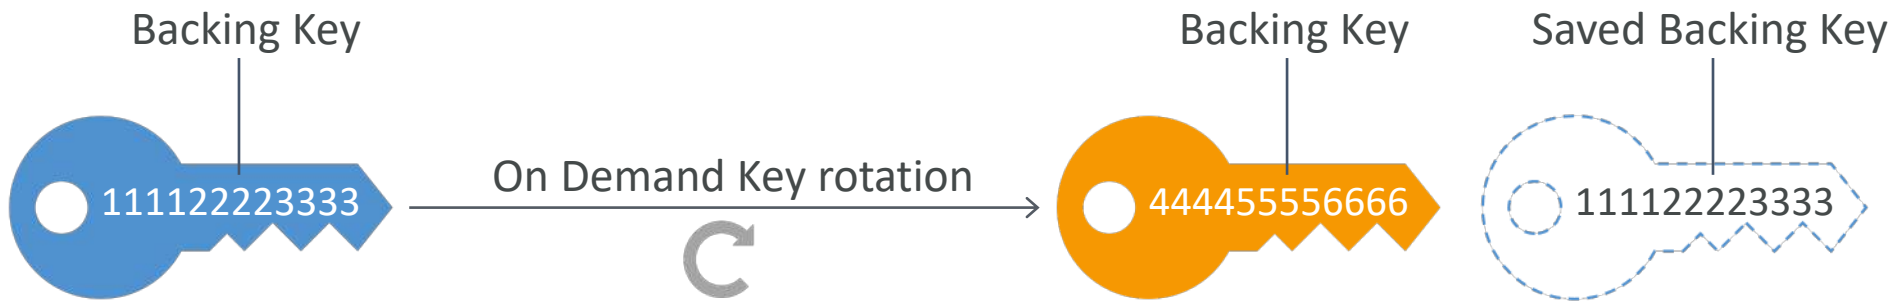

KMS Key ID = 1234abcd-12ab-34cd-56ef-1234567890ab   KMS Key ID = 1234abcd-12ab-34cd-56ef-1234567890ab

KMS Manual Key Rotation
(Customer-Managed Symmetric KMS Key & Imports)

- **When you want to rotate key (example: every month)**
- New Key has a different KMS Key ID
- Keep the previous key active so you can decrypt old data
- Better to use aliases in this case (to hide the change of key for the application)
- Good solution to rotate KMS Key that are not eligible for automatic rotation (like **asymmetric KMS Key**)

Client — Rotate Key Manually → Client

111122223333
Alias = MyCustomKey
KMS Key ID = 1234abcd-12ab-34cd-56ef-1234567890ab

111122223333
Alias = MyCustomKey
KMS Key ID = 1234abcd-12ab-34cd-56ef-1234567890ab

444455556666
Alias = MyCustomKey
KMS Key ID = 0978dcba-09fe-65ba-ab0987654321
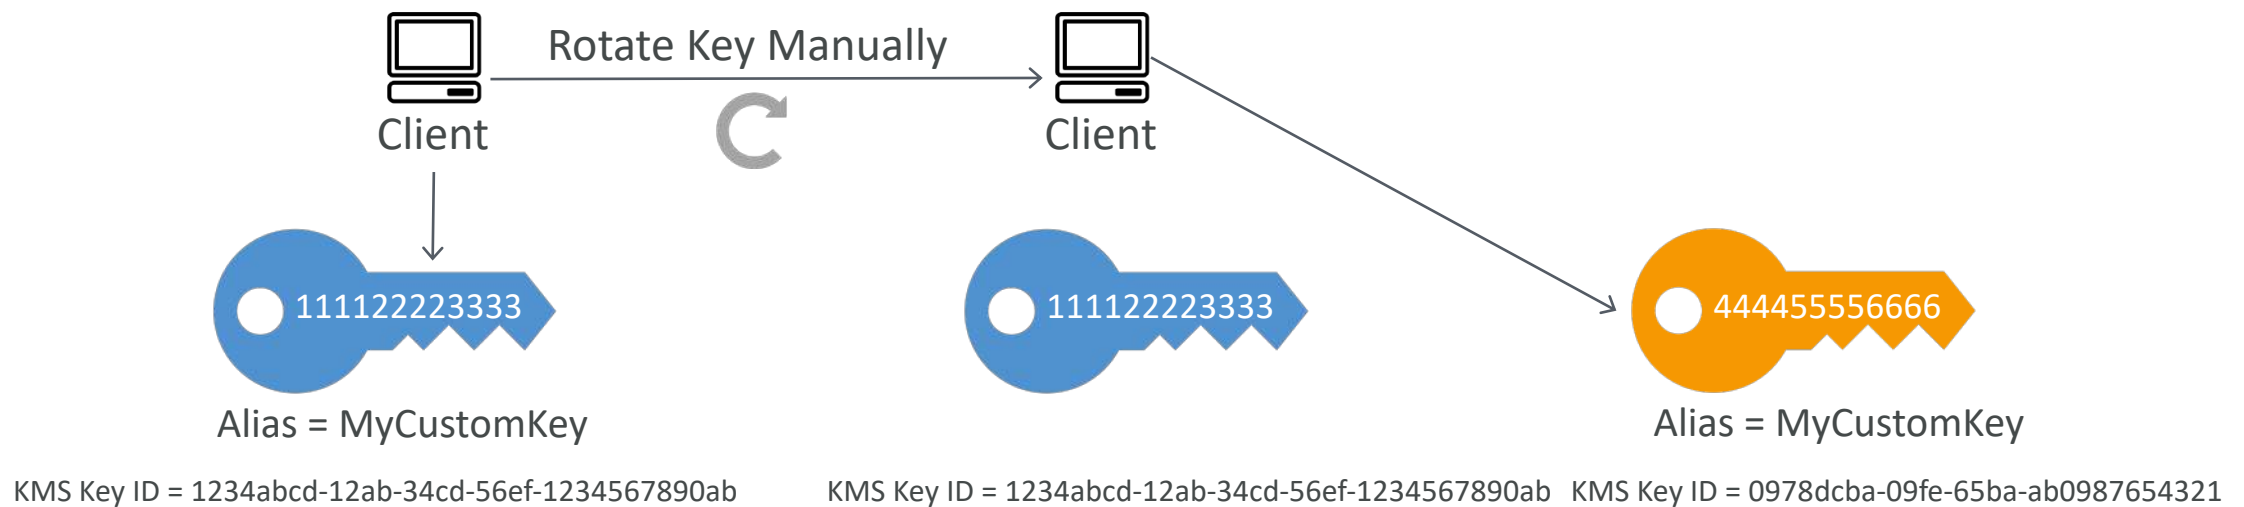

KMS Alias Updating

- Better to use aliases in this case (to hide the change of key for the application)

Application

Key Alias = *MyAppKey*

UpdateAlias API

OLD KEY

NEW KEY

KMS Key ID = eba96e8f-7f66-4d5a-aeb6-f32ae8d65d85

KMS Key ID = 881cd7f5-b3eb-43e2-82fc-d6f5bda81e00
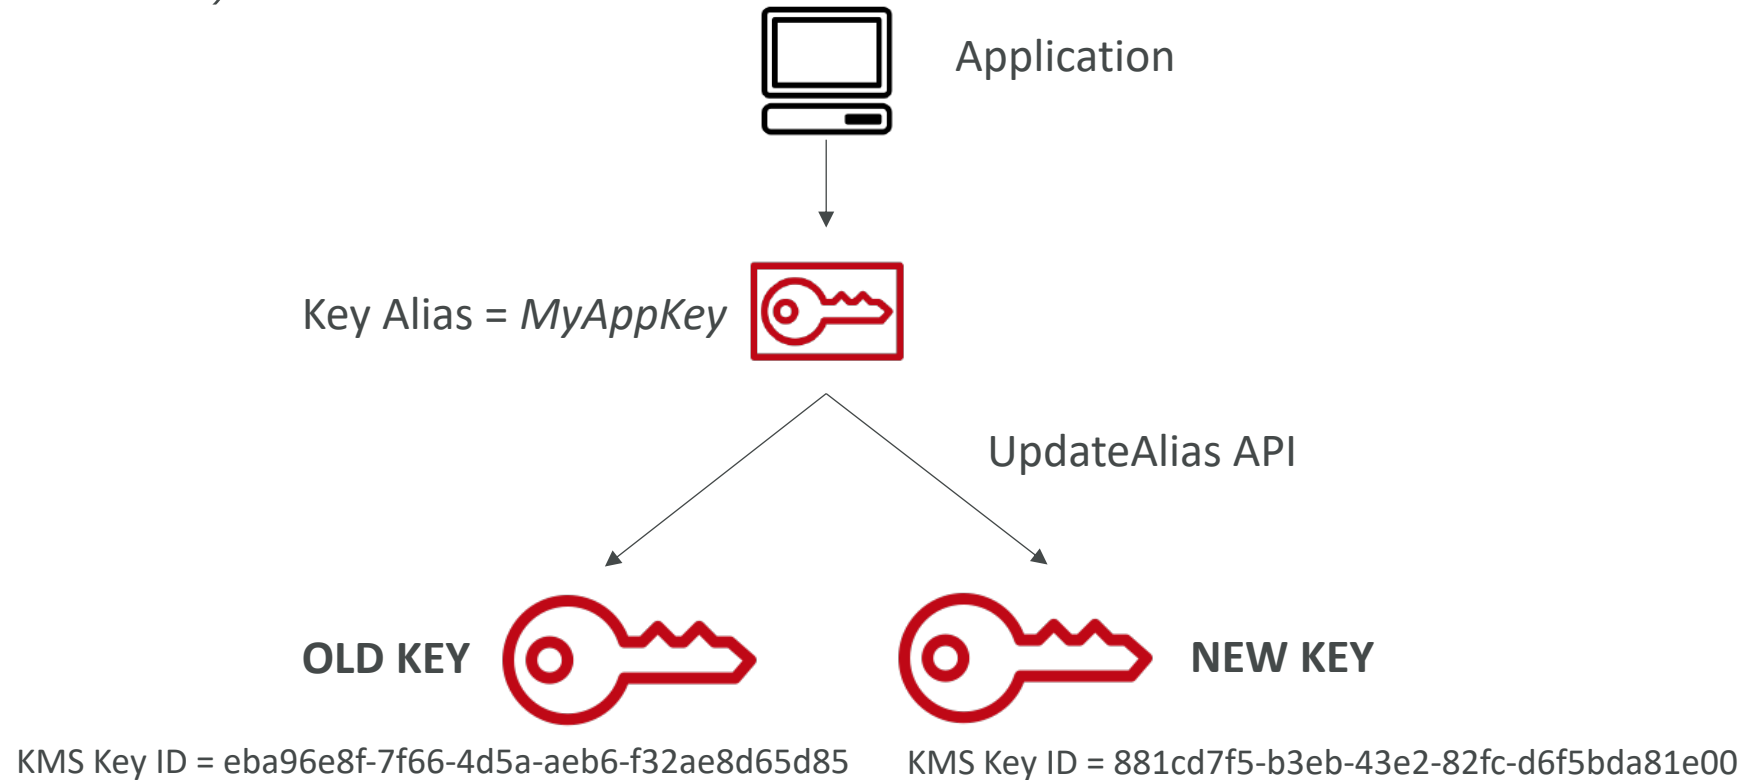

Changing The KMS Key For An Encrypted EBS Volume

- You can't change the encryption keys used by an EBS volume
- Create an EBS snapshot and create a new EBS volume and specify the new KMS key
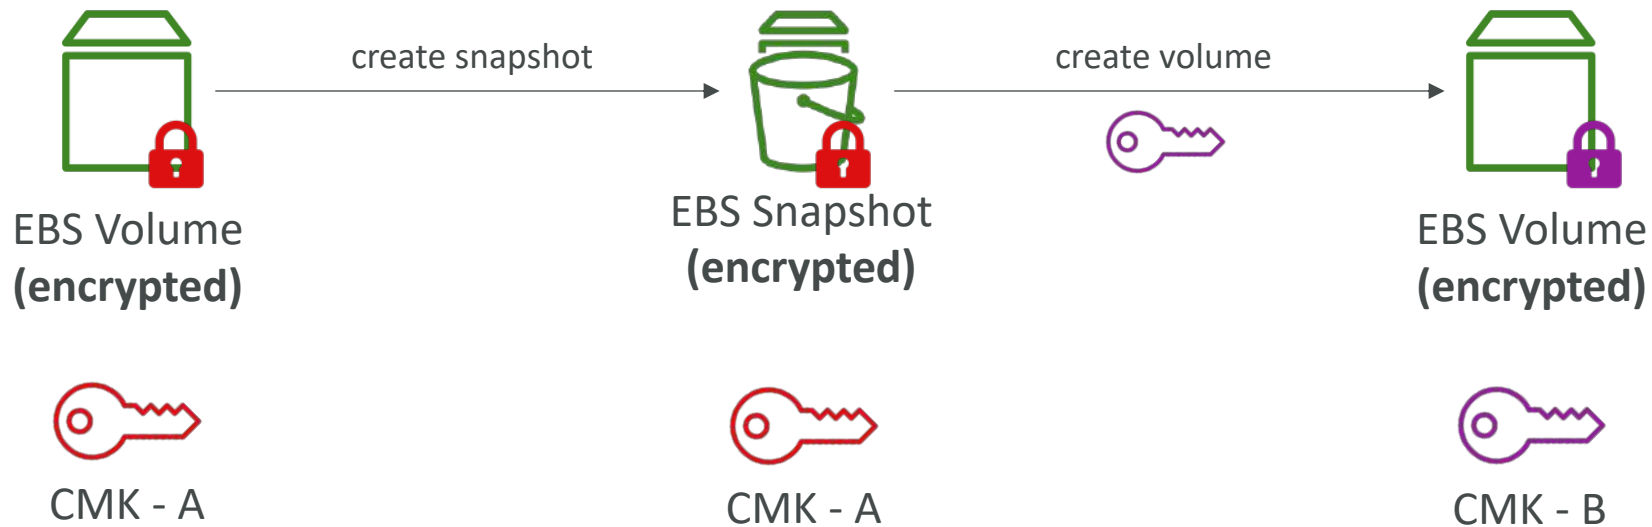

Sharing KMS Encrypted RDS DB Snapshots

- You can share RDS DB snapshots encrypted with KMS CMK with other accounts, **but must first share the KMS CMK with the target account using Key Policy**

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": ["arn:aws:iam::444455556666:root"]
            },
            "Action": [
                "kms:CreateGrant",
                "kms:Encrypt",
                "kms:Decrypt",
                "kms:ReEncrypt*",
                "kms:GenerateDataKey*",
                "kms:DescribeKey"
            ],
            "Resource": "*"
        }
    ]
}
```

DB Instance (Snapshot: mydbsnapshot)

KMS Key Deletion Considerations

- Schedule CMK for deletion with a waiting period of 7 to 30 days
  - CMK's status is **"Pending deletion"** during the waiting period

- During the CMK's deletion waiting period:
  - **The CMK can't be used for cryptographic operations** (e.g., can't decrypt KMS-encrypted objects in S3 – SSE-KMS)
  - The key is not rotated even if planned

- You can cancel the key deletion during the waiting period

- Consider disabling your key instead of deleting it if you're not sure!

KMS Key Deletion – CloudWatch Alarm

- Use CloudTrail, CloudWatch Logs, CloudWatch Alarms and SNS to be notified when someone tries to use a CMK that's **"Pending deletion"** in a cryptographic operation (Encrypt, Decrypt, …)
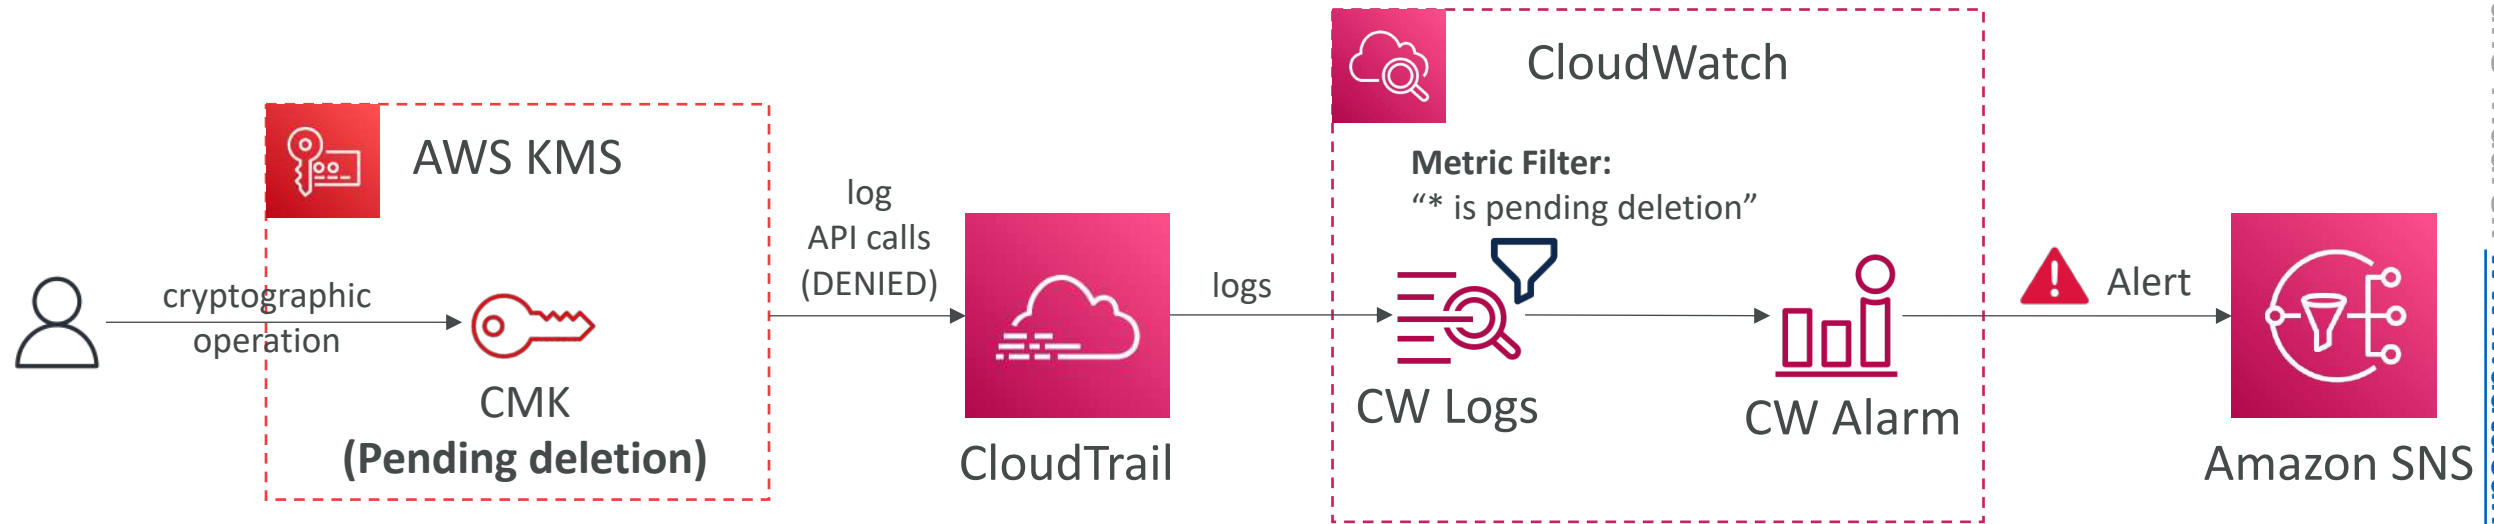

CloudHSM

- KMS => AWS manages the software for encryption
- CloudHSM => AWS provisions encryption **hardware**
- Dedicated Hardware (HSM = Hardware Security Module)
- You manage your own encryption keys entirely (not AWS)
- HSM device is tamper resistant, FIPS 140-2 Level 3 compliance
- Supports both symmetric and **asymmetric** encryption (SSL/TLS keys)
- No free tier available
- Must use the CloudHSM Client Software
- Redshift supports CloudHSM for database encryption and key management
- **Good option to use with SSE-C encryption**

CloudHSM Diagram

AWS manages the Hardware

SSL Connection

User manages the Keys

CloudHSM Client
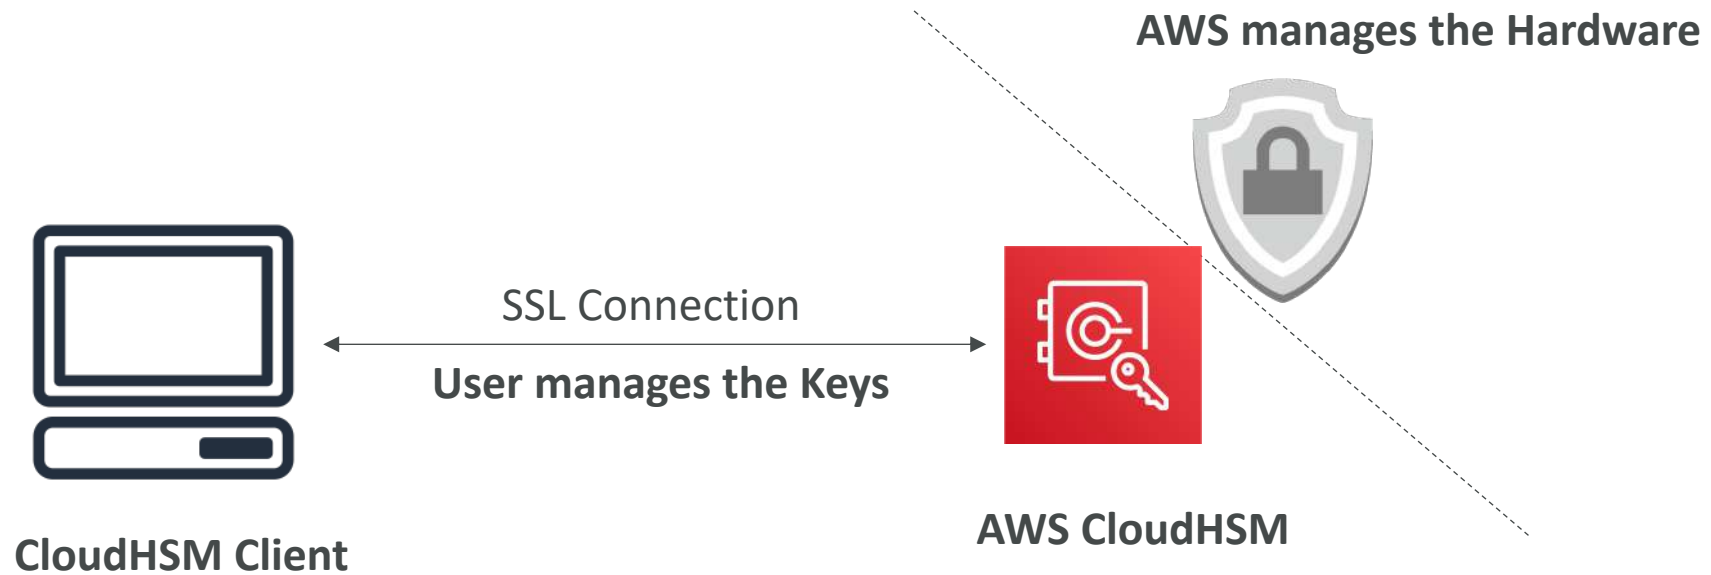

AWS CloudHSM

IAM permissions:

• CRUD an HSM Cluster

CloudHSM Software:

• Manage the Keys

• Manage the Users

CloudHSM – High Availability

- CloudHSM clusters are spread across Multi AZ (HA)
- Great for availability and durability

Availability Zone 1

CloudHSM 1

CloudHSM Client

Availability Zone 2
CloudHSM 2

CloudHSM – Integration with AWS Services

- Through integration with AWS KMS

- Configure KMS Custom Key Store with CloudHSM

- Example: EBS, S3, RDS …
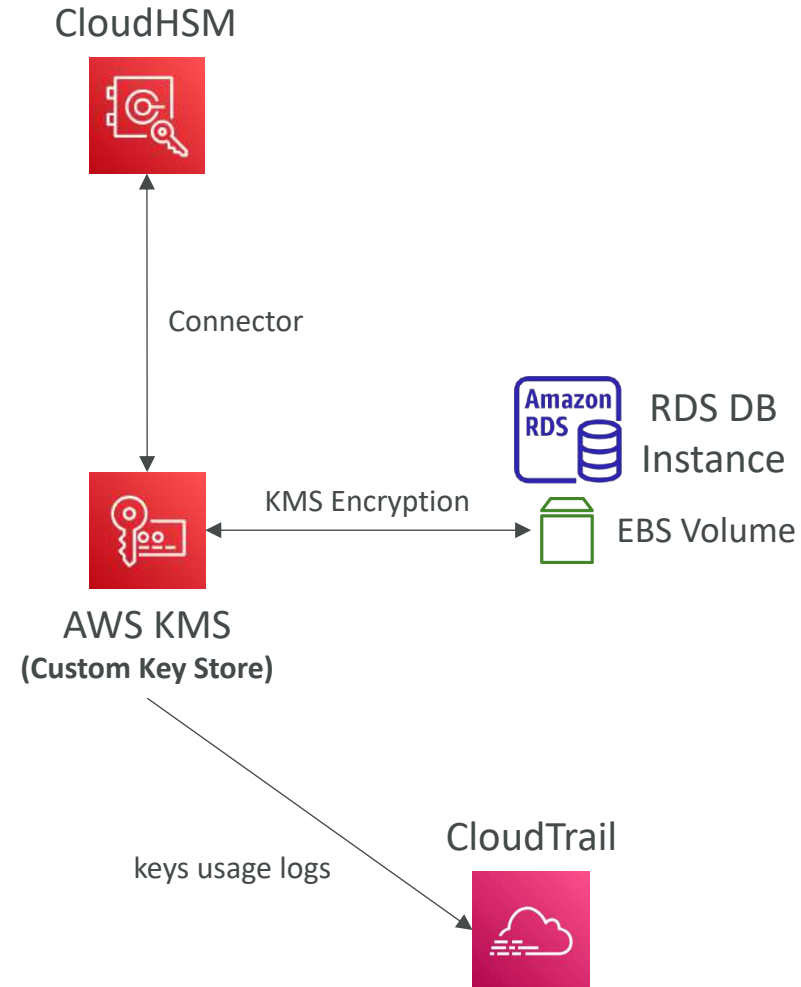

CloudHSM vs. KMS

Feature	AWS KMS	AWS CloudHSM
Tenancy	Multi-Tenant	Single-Tenant
Standard	FIPS 140-2 Level 3	FIPS 140-2 Level 3
Master Keys	• AWS Owned CMK • AWS Managed CMK • Customer Managed CMK	Customer Managed CMK
Key Types	• Symmetric • Asymmetric • Digital Signing	• Symmetric • Asymmetric • Digital Signing & Hashing
Key Accessibility	Accessible in multiple AWS regions (can't access keys outside the region it's created in)	• Deployed and managed in a VPC • Can be shared across VPCs (VPC Peering)
Cryptographic Acceleration	None	• SSL/TLS Acceleration • Oracle TDE Acceleration
Access & Authentication	AWS IAM	You create users and manage their permissions

CloudHSM vs. KMS

Feature	AWS KMS	AWS CloudHSM
High Availability	AWS Managed Service	Add multiple HSMs over different AZs
Audit Capability	• CloudTrail • CloudWatch	• CloudTrail • CloudWatch • MFA support
Free Tier	Yes	No

AWS Artifact (not really a service)

- Portal that provides customers with on-demand access to AWS compliance documentation and AWS agreements

- Artifact Reports - Allows you to download AWS security and compliance documents from third-party auditors, like AWS ISO certifications, Payment Card Industry (PCI), and System and Organization Control (SOC) reports

- Artifact Agreements - Allows you to review, accept, and track the status of AWS agreements such as the Business Associate Addendum (BAA) or the Health Insurance Portability and Accountability Act (HIPAA) for an individual account or in your organization

- Can be used to **support internal audit or compliance**

AWS Certificate Manager (ACM)

- Easily provision, manage, and deploy **TLS Certificates**

- Provide in-flight encryption for websites (HTTPS)

- Supports both public and private TLS certificates

- Free of charge for public TLS certificates

- Automatic TLS certificate renewal

- Integrations with (load TLS certificates on)
  - Elastic Load Balancers (CLB, ALB, NLB)
  - CloudFront Distributions
  - APIs on API Gateway

- Cannot use ACM with EC2 (can't be extracted)

HTTPS

provision and
maintain TLS certs

Application

EC2 Instance   EC2 Instance
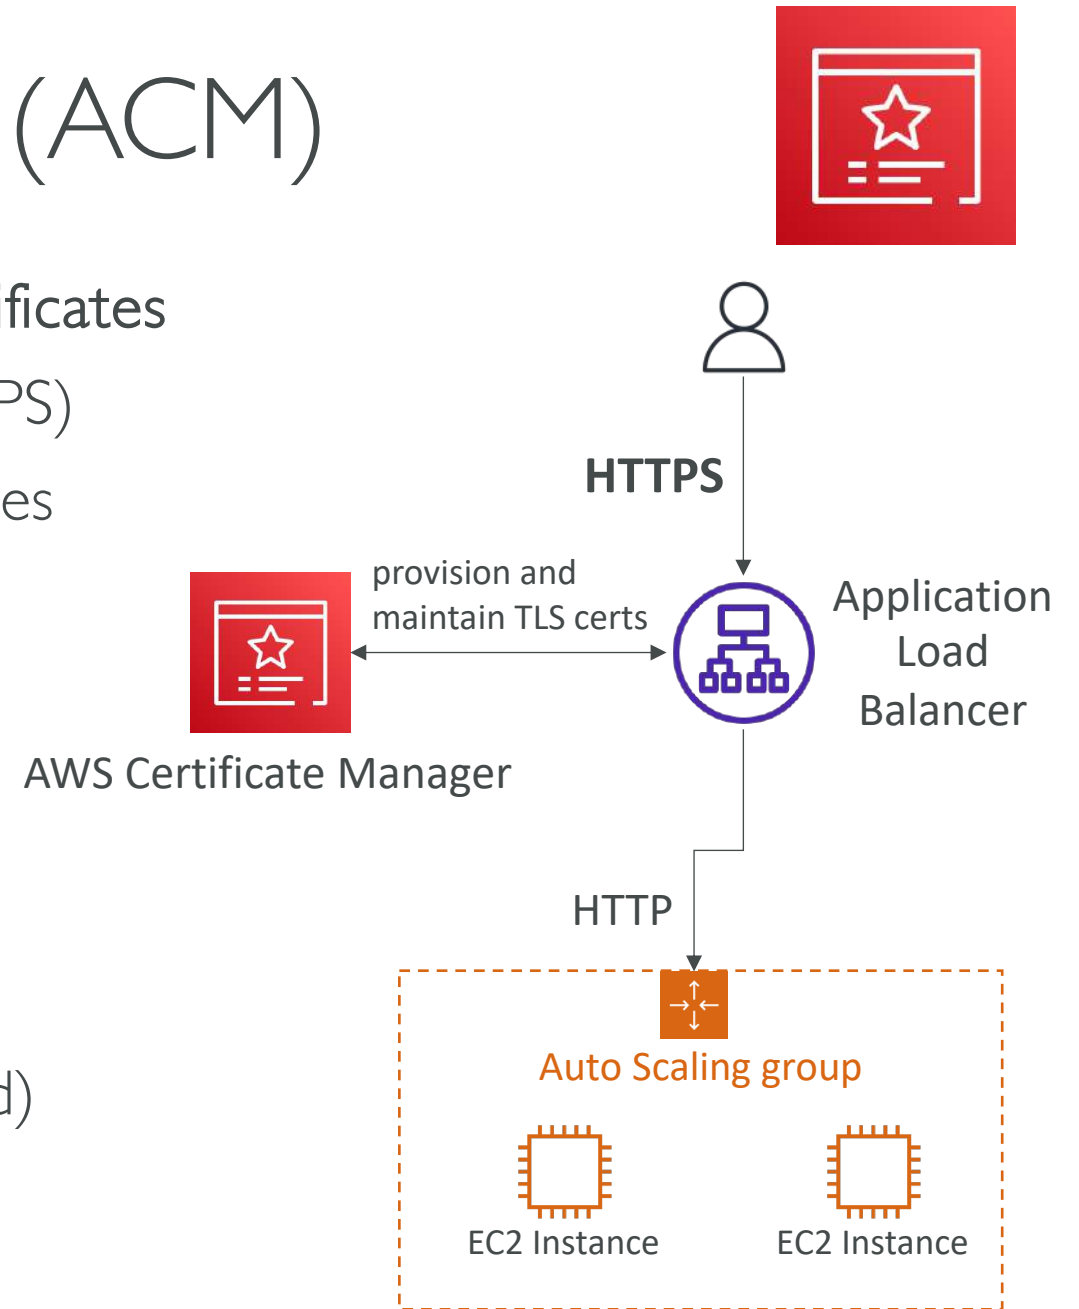

ACM – Requesting Public Certificates

1. List domain names to be included in the certificate
   - Fully Qualified Domain Name (FQDN): corp.example.com
   - Wildcard Domain: *.example.com

2. Select Validation Method: DNS Validation or Email validation
   - DNS Validation is preferred for automation purposes
   - Email validation will send emails to contact addresses in the WHOIS database
   - DNS Validation will leverage a CNAME record to DNS config (ex: Route 53)

3. It will take a few hours to get verified

4. The Public Certificate will be enrolled for automatic renewal
   - ACM automatically renews ACM-generated certificates 60 days before expiry

ACM – Importing Public Certificates

- Option to generate the certificate outside of ACM and then import it
- **No automatic renewal**, must import a new certificate before expiry
- ACM sends daily expiration events starting 45 days prior to expiration
  - The # of days can be configured
  - Events are appearing in EventBridge
- AWS Config has a managed rule named *acm-certificate-expiration-check* to check for expiring certificates (configurable number of days)

ACM

ACM Events:

API Gateway - Endpoint Types

- **Edge-Optimized (default):** For global clients
  - Requests are routed through the CloudFront Edge locations (improves latency)
  - The API Gateway still lives in only one region

- **Regional:**
  - For clients within the same region
  - Could manually combine with CloudFront (more control over the caching strategies and the distribution)

- **Private:**
  - Can only be accessed from your VPC using an interface VPC endpoint (ENI)
  - Use a resource policy to define access

ACM – Integration with API Gateway

- Create a **Custom Domain Name** in API Gateway

- **Edge-Optimized (default):** For global clients
  - Requests are routed through the CloudFront Edge locations (improves latency)
  - The API Gateway still lives in only one region
  - **The TLS Certificate must be in the same region as CloudFront, in us-east-1**
  - Then setup CNAME or (better) A-Alias record in Route 53

- Regional:
  - For clients within the same region
  - **The TLS Certificate must be imported on API Gateway, in the same region as the API Stage**
  - Then setup CNAME or (better) A-Alias record in Route 53
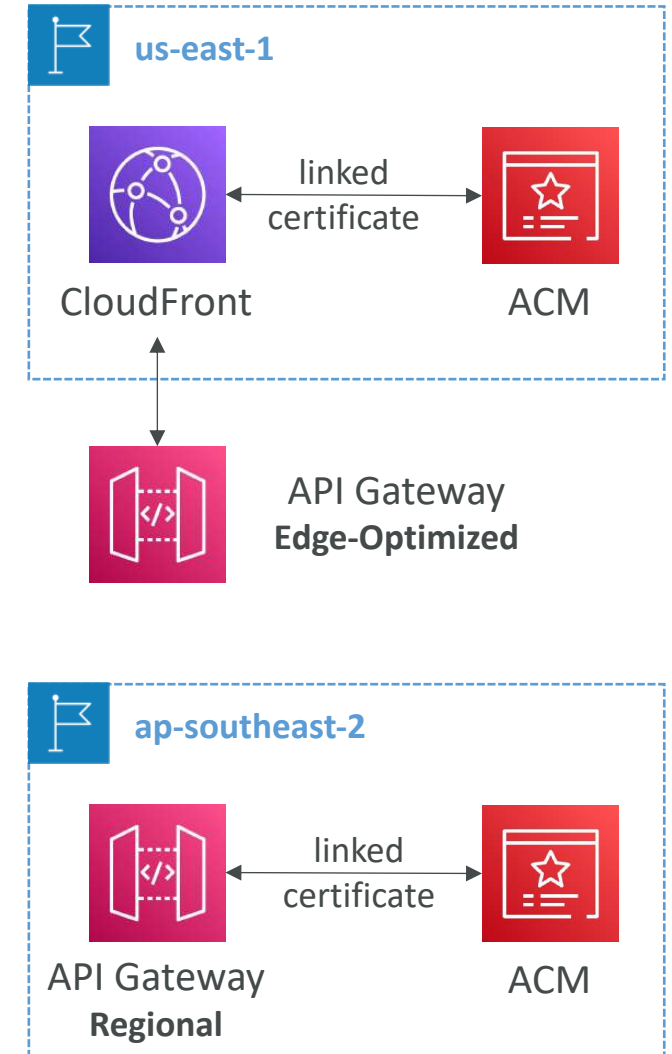

us-east-1

CloudFront ←→ linked certificate ←→ ACM

API Gateway **Edge-Optimized**

GetParameters or
GetParametersByPath API

Dev Lambda Function

Prod Lambda Function

Standard and advanced parameter tiers

	Standard	Advanced
Total number of parameters allowed (per AWS account and Region)	10,000	100,000
Maximum size of a parameter value	4 KB	8 KB
Parameter policies available	No	Yes
Cost	No additional charge	Charges apply
Storage Pricing	Free	$0.05 per advanced parameter per month
API Interaction Pricing (higher throughput = up to 1000 Transactions per second)	Standard Throughput: free Higher Throughput: $0.05 per 10,000 API interactions	Standard Throughput: $0.05 per 10,000 API interactions Higher Throughput: $0.05 per 10,000 API interactions

Parameters Policies (for advanced parameters)

- Allow to assign a TTL to a parameter (expiration date) to force updating or deleting sensitive data such as passwords
- Can assign multiple policies at a time

Expiration (to delete a parameter)

```
{
    "Type":"Expiration",
    "Version":"1.0",
    "Attributes":{
        "Timestamp":"2020-12-02T21:34:33.000Z"
    }
}
```

ExpirationNotification (CW Events)

```
{
    "Type":"ExpirationNotification",
    "Version":"1.0",
    "Attributes":{
        "Before":"15",
        "Unit":"Days"
    }
}
```

NoChangeNotification (CW Events)

```
{
    "Type":"NoChangeNotification",
    "Version":"1.0",
    "Attributes":{
        "After":"20",
        "Unit":"Days"
    }
}
```

AWS Secrets Manager

- Newer service, meant for storing secrets
- Capability to force **rotation of secrets** every X days
- Automate generation of secrets on rotation (uses Lambda)
- Integration with **Amazon RDS** (MySQL, PostgreSQL, Aurora)
- Secrets are encrypted using KMS

- Mostly meant for RDS integration

AWS Secrets Manager – Multi-Region Secrets

- Replicate Secrets across multiple AWS Regions
- Secrets Manager keeps read replicas in sync with the primary Secret
- Ability to promote a read replica Secret to a standalone Secret
- Use cases: multi-region apps, disaster recovery strategies, multi-region DB…
SSM Parameter Store vs Secrets Manager

- Secrets Manager ($$$):
  - Automatic rotation of secrets with AWS Lambda
  - Lambda function is provided for RDS, Redshift, DocumentDB
  - KMS encryption is mandatory
  - Can integration with CloudFormation
- SSM Parameter Store ($):
  - Simple API
  - No secret rotation (can enable rotation using Lambda triggered by EventBridge)
  - KMS encryption is optional
  - Can integration with CloudFormation
  - Can pull a Secrets Manager secret using the SSM Parameter Store API
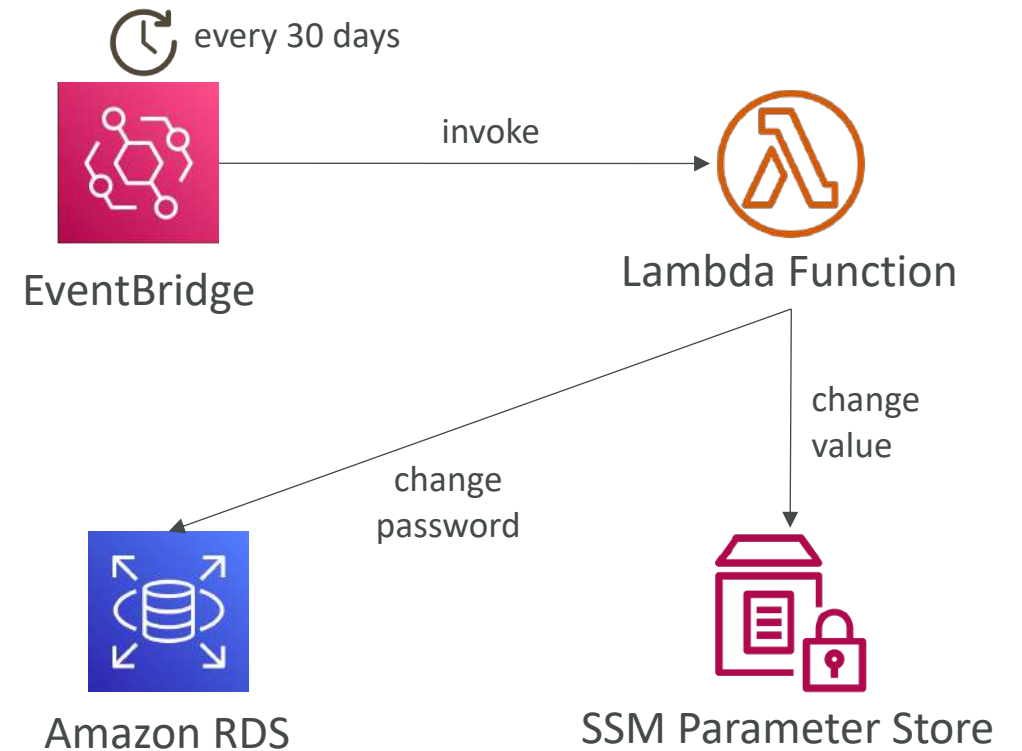

Secrets Manager – Monitoring

- CloudTrail captures API calls to the Secrets Manager API
- CloudTrail captures other related events that might have a security or compliance impact on your AWS account or might help you troubleshoot operational problems.
- **CloudTrail records these events as non-API service events.**
  - RotationStarted event
  - RotationSucceeded event
  - RotationFailed event
  - RotationAbandoned event – a manual change to a secret instead of automated rotation
  - StartSecretVersionDelete event
  - CancelSecretVersionDelete event
  - EndSecretVersionDelete event
- Combine with CloudWatch Logs and CloudWatch alarms for automations

Secrets Manager – Troubleshooting Rotation
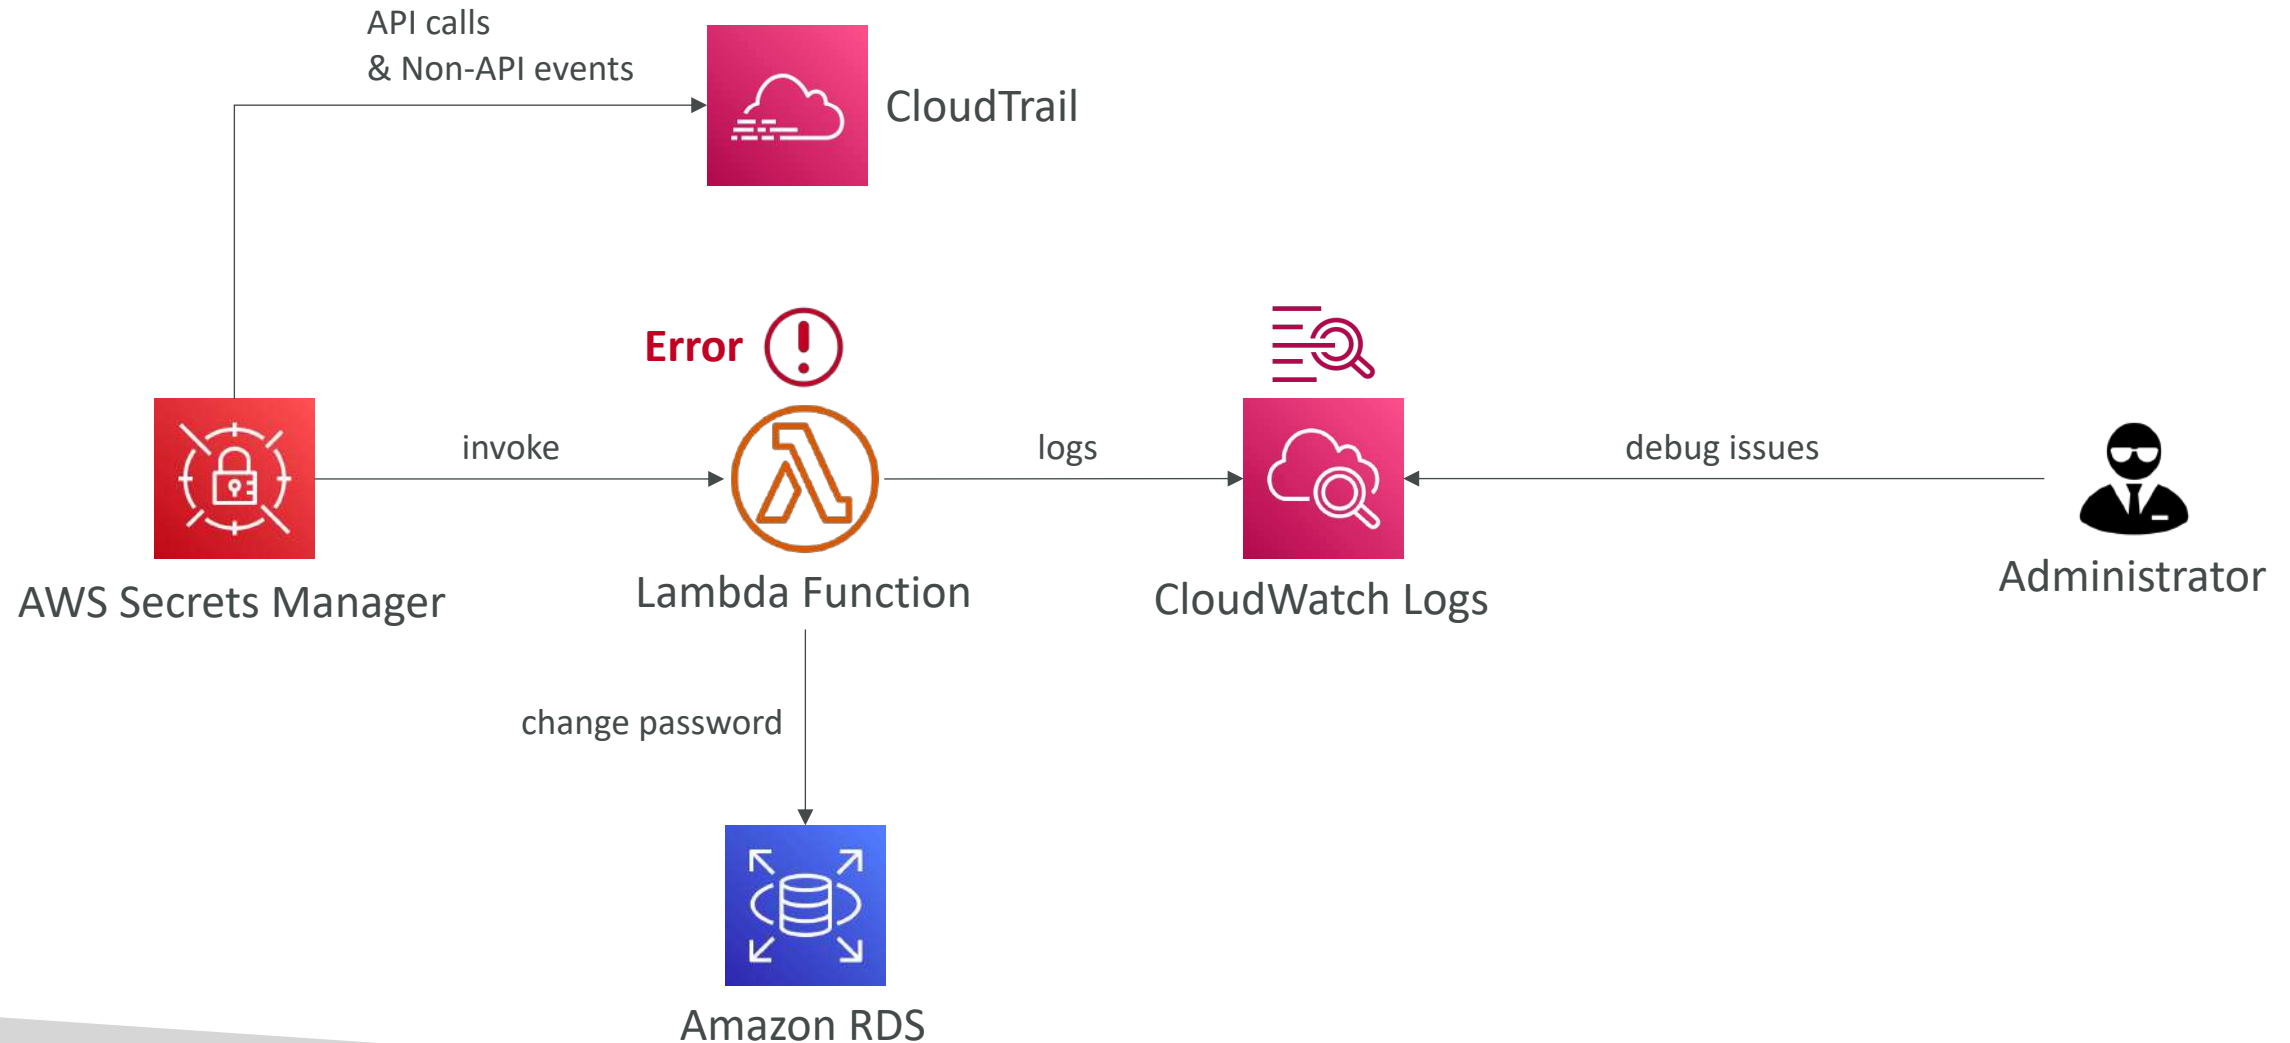

Identity

IAM Security Tools

- IAM Credentials Report (account-level)
  - a report that lists all your account's users and the status of their various credentials

- IAM Access Advisor (user-level)
  - Access advisor shows the service permissions granted to a user and when those services were last accessed.
  - You can use this information to revise your policies.

IAM Access Analyzer

- Find out which resources are shared externally
  - S3 Buckets
  - IAM Roles
  - KMS Keys
  - Lambda Functions and Layers
  - SQS queues
  - Secrets Manager Secrets

- Define **Zone of Trust** = AWS Account or AWS Organization

- Access outside zone of trusts => findings

Zone of trust

Role   User   Account

VPC Endpoints   S3 Bucket   External Client
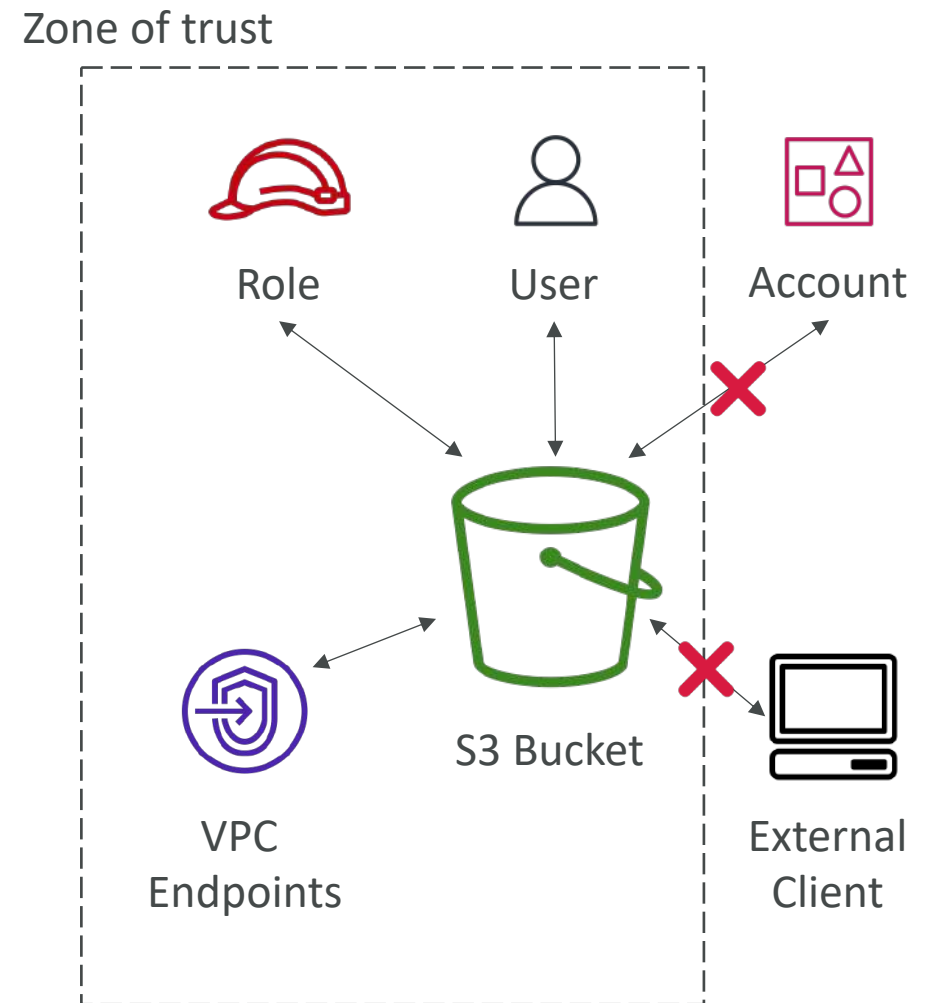

What's Identity Federation?

- Federation lets users outside of AWS to assume temporary role for accessing AWS resources.
- These users assume identity provided access role.
- Federation assumes a form of 3rd party authentication
  - LDAP
  - Microsoft Active Directory (~= SAML)
  - Single Sign On
  - Open ID
  - Cognito
- Using federation, you don't need to create IAM users (user management is outside of AWS)

user

3rd party

login

Gives credentials

Access AWS

Trust

aws
SAML Federation
For Enterprises

- To integrate Active Directory / ADFS with AWS (or any SAML 2.0)
- Provides access to AWS Console or CLI (through temporary creds)
- No need to create an IAM user for each of your employees
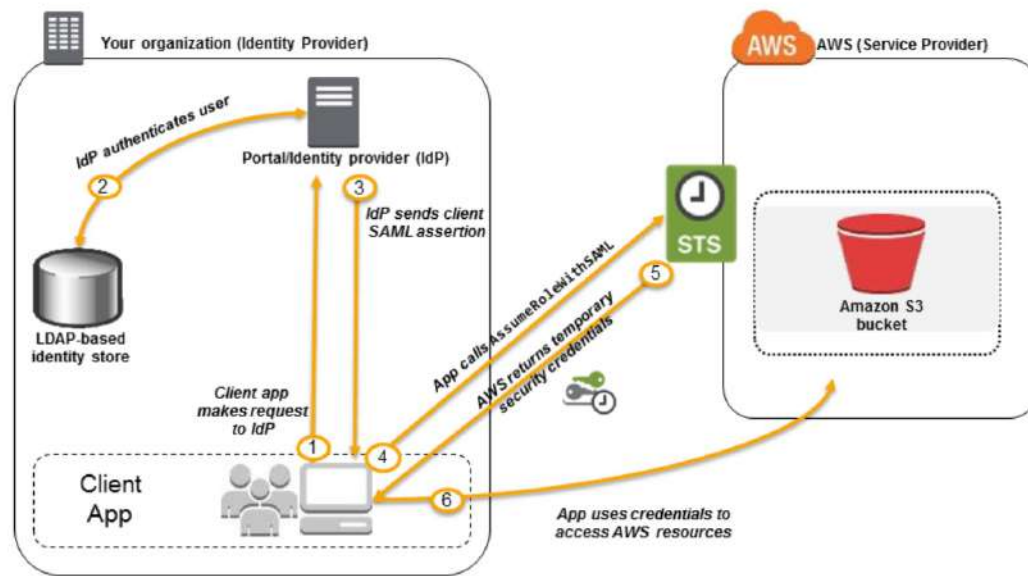

https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_providers_saml.html
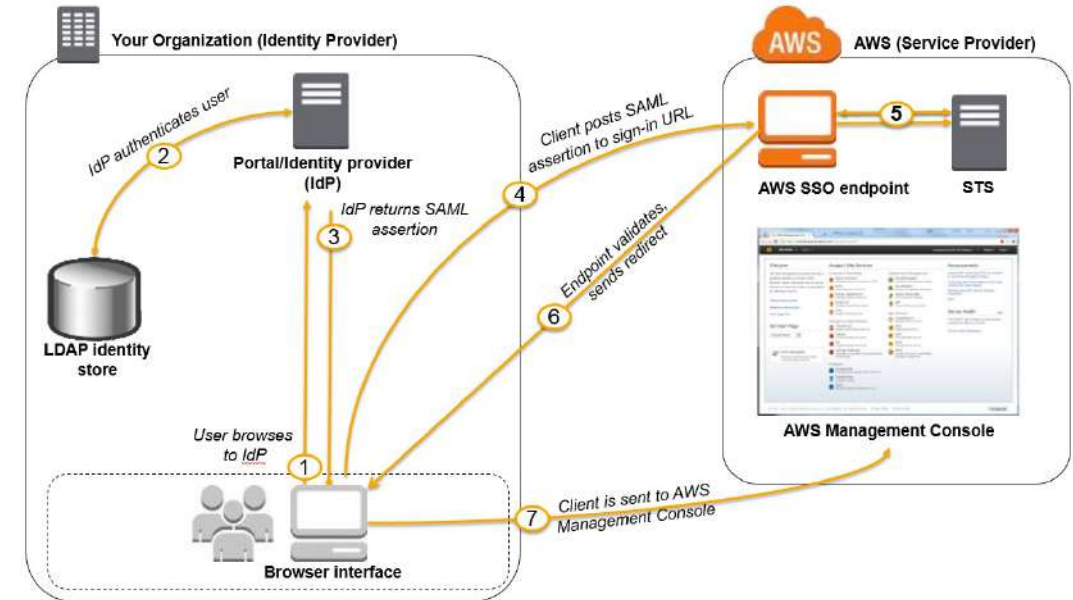

https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_providers_enable-console-saml.html

Custom Identity Broker Application
For Enterprises

- Use only if identity provider is not compatible with SAML 2.0
- The identity broker must determine the appropriate IAM policy
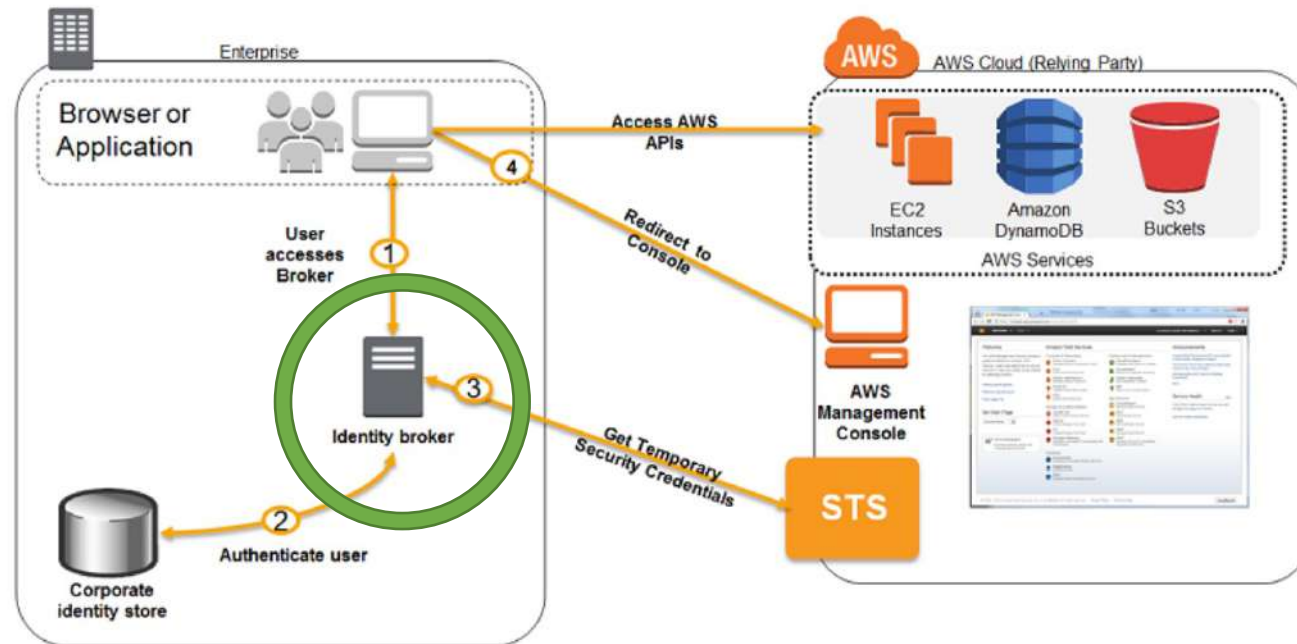

https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_
common-scenarios_federated-users.html

AWS Cognito - Federated Identity Pools
For Public Applications

- Goal:
  - Provide direct access to AWS Resources from the Client Side
- How:
  - Log in to federated identity provider – or remain anonymous
  - Get temporary AWS credentials back from the Federated Identity Pool
  - These credentials come with a pre-defined IAM policy stating their permissions
- Example:
  - provide (temporary) access to write to S3 bucket using Facebook Login
- Note:
  - Web Identity Federation is an alternative to using Cognito but AWS recommends against it

Identity Provider

CUP   **Google**   **Facebook**   **Twitter SAML OpenID ....**

login   token   verify token

App   Authenticate to FIP

temp AWS credentials   **Federated Identity**

call   Get credentials

Amazon S3 bucket   **STS**
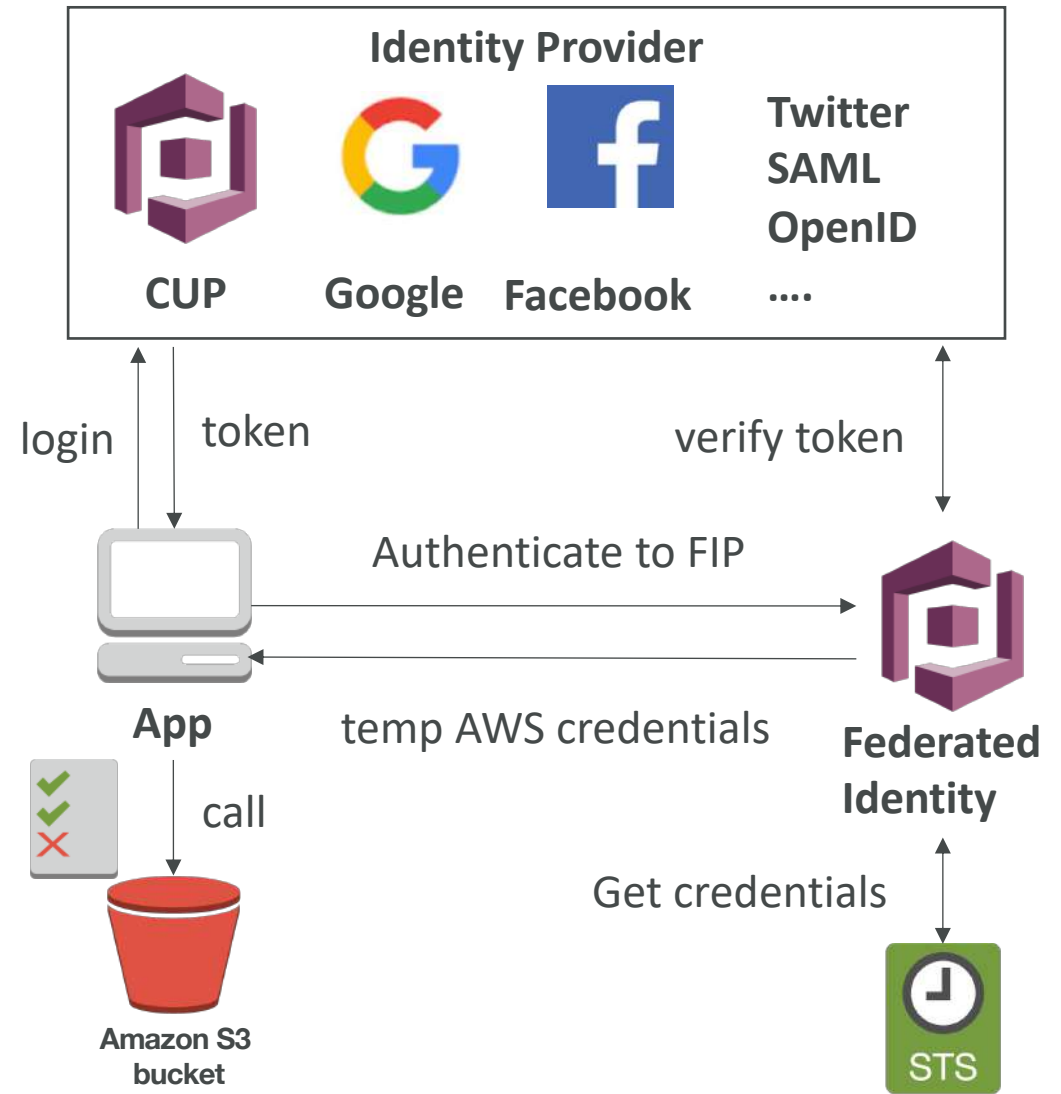

AWS STS – Security Token Service

- Allows to grant limited and temporary access to AWS resources.

- Token is valid for up to one hour (must be refreshed)

- AssumeRole
  - Within your own account: for enhanced security
  - Cross Account Access: assume role in target account to perform actions there

- AssumeRoleWithSAML
  - return credentials for users logged with SAML

- AssumeRoleWithWebIdentity
  - return creds for users logged with an IdP (Facebook Login, Google Login, OIDC compatible…)
  - AWS recommends against using this, and using **Cognito** instead

- GetSessionToken
  - for MFA, from a user or AWS account root user

Using STS to Assume a Role

- Define an IAM Role within your account or cross-account
- Define which principals can access this IAM Role
- Use AWS STS (Security Token Service) to retrieve credentials and impersonate the IAM Role you have access to (**AssumeRole API**)
- Temporary credentials can be valid between 15 minutes to 1 hour

AssumeRole API

user

IAM Group
(Testers)
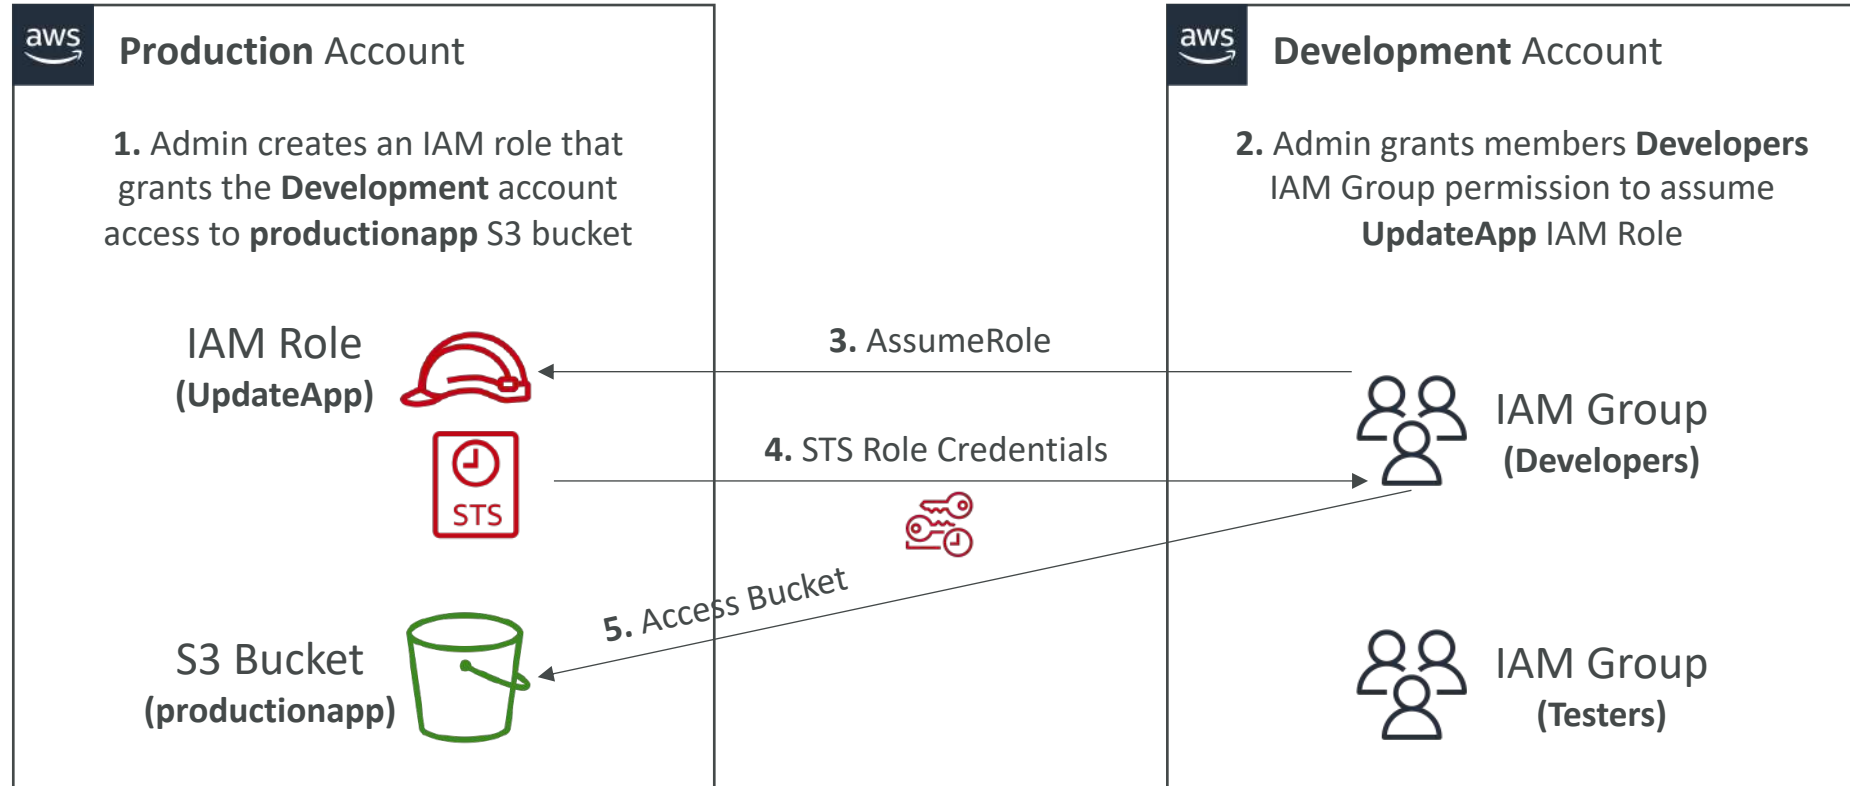

Cognito User Pools (CUP) – User Features

- Create a serverless database of user for your web & mobile apps
- Simple login: Username (or email) / password combination
- Password reset
- Email & Phone Number Verification
- Multi-factor authentication (MFA)
- Federated Identities: users from Facebook, Google, SAML…
- Feature: block users if their credentials are compromised elsewhere
- Login sends back a JSON Web Token (JWT)

Social Identity Provider

Federation through Third Party Identity Provider (IdP)
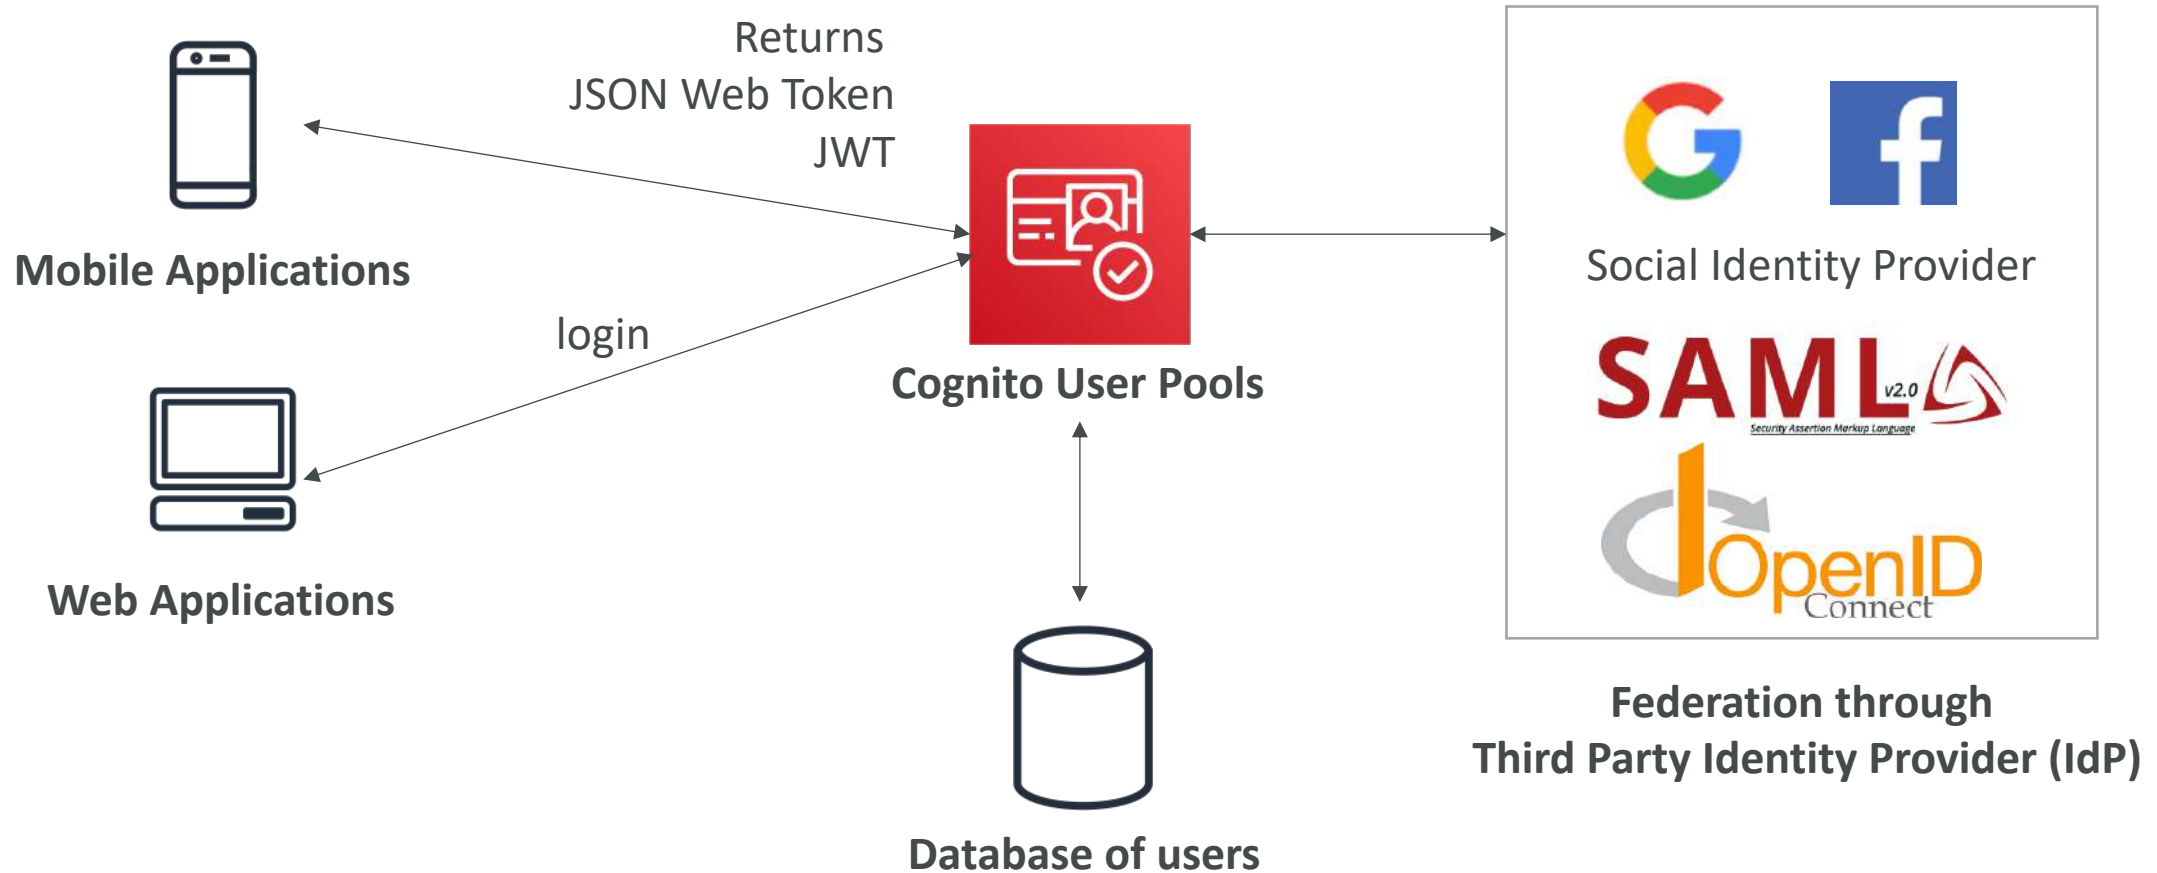

Cognito User Pools (CUP) - Integrations

- CUP integrates with **API Gateway** and **Application Load Balancer**
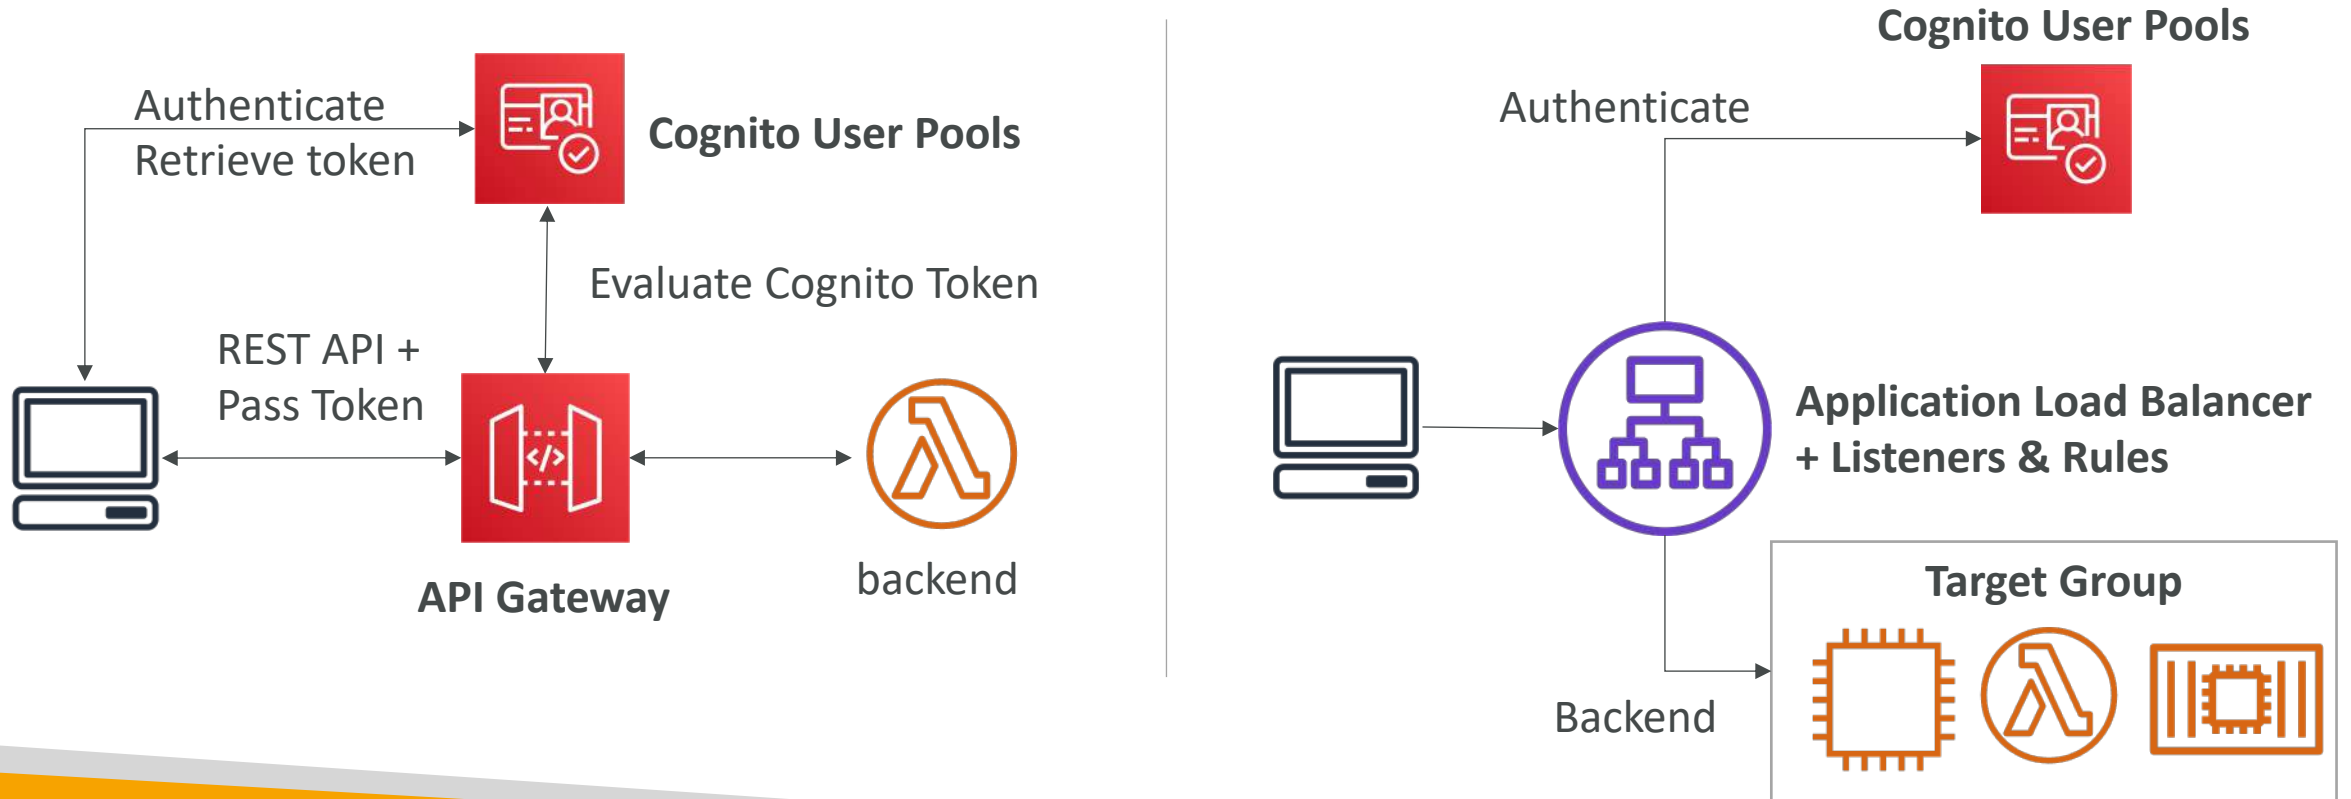

Cognito Identity Pools (Federated Identities)

- Get identities for "users" so they obtain temporary AWS credentials

- Your identity pool (e.g identity source) can include:
  - Public Providers (Login with Amazon, Facebook, Google, Apple)
  - Users in an Amazon Cognito user pool
  - OpenID Connect Providers & SAML Identity Providers
  - Developer Authenticated Identities (custom login server)
  - Cognito Identity Pools allow for <u>unauthenticated (guest) access</u>

- Users can then access AWS services directly or through API Gateway
  - The IAM policies applied to the credentials are defined in Cognito
  - They can be customized based on the user_id for fine grained control

Cognito Identity Pools – IAM Roles

- Default IAM roles for authenticated and guest users

- Define rules to choose the role for each user based on the user's ID

- You can partition your users' access using **policy variables**

- IAM credentials are obtained by Cognito Identity Pools through STS

- The roles must have a "trust" policy of Cognito Identity Pools

Cognito Identity Pools – Guest User example

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Action": [
                "s3:GetObject"
            ],
            "Effect": "Allow",
            "Resource": [
                "arn:aws:s3:::mybucket/assets/my_picture.jpg"
            ]
        }
    ]
}
```

Cognito Identity Pools – Policy variable on S3

```json
{
    "Version": "2012-10-17",
    "Statement": [
      {
        "Action": ["s3:ListBucket"],
        "Effect": "Allow",
        "Resource": ["arn:aws:s3:::mybucket"],
        "Condition": {"StringLike": {"s3:prefix": ["${cognito-identity.amazonaws.com:sub}/*"]}}
      },
      {
        "Action": [
          "s3:GetObject",
          "s3:PutObject"
        ],
        "Effect": "Allow",
        "Resource": ["arn:aws:s3:::mybucket/${cognito-identity.amazonaws.com:sub}/*"]
      }
    ]
}
```

Cognito Identity Pools – DynamoDB

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "dynamodb:GetItem", "dynamodb:BatchGetItem", "dynamodb:Query",
                "dynamodb:PutItem", "dynamodb:UpdateItem", "dynamodb:DeleteItem",
                "dynamodb:BatchWriteItem"
            ],
            "Resource": [
                "arn:aws:dynamodb:us-west-2:123456789012:table/MyTable"
            ],
            "Condition": {
                "ForAllValues:StringEquals": {
                    "dynamodb:LeadingKeys": [
                        "${cognito-identity.amazonaws.com:sub}"
                    ]
                }
            }
        }
    ]
}
```
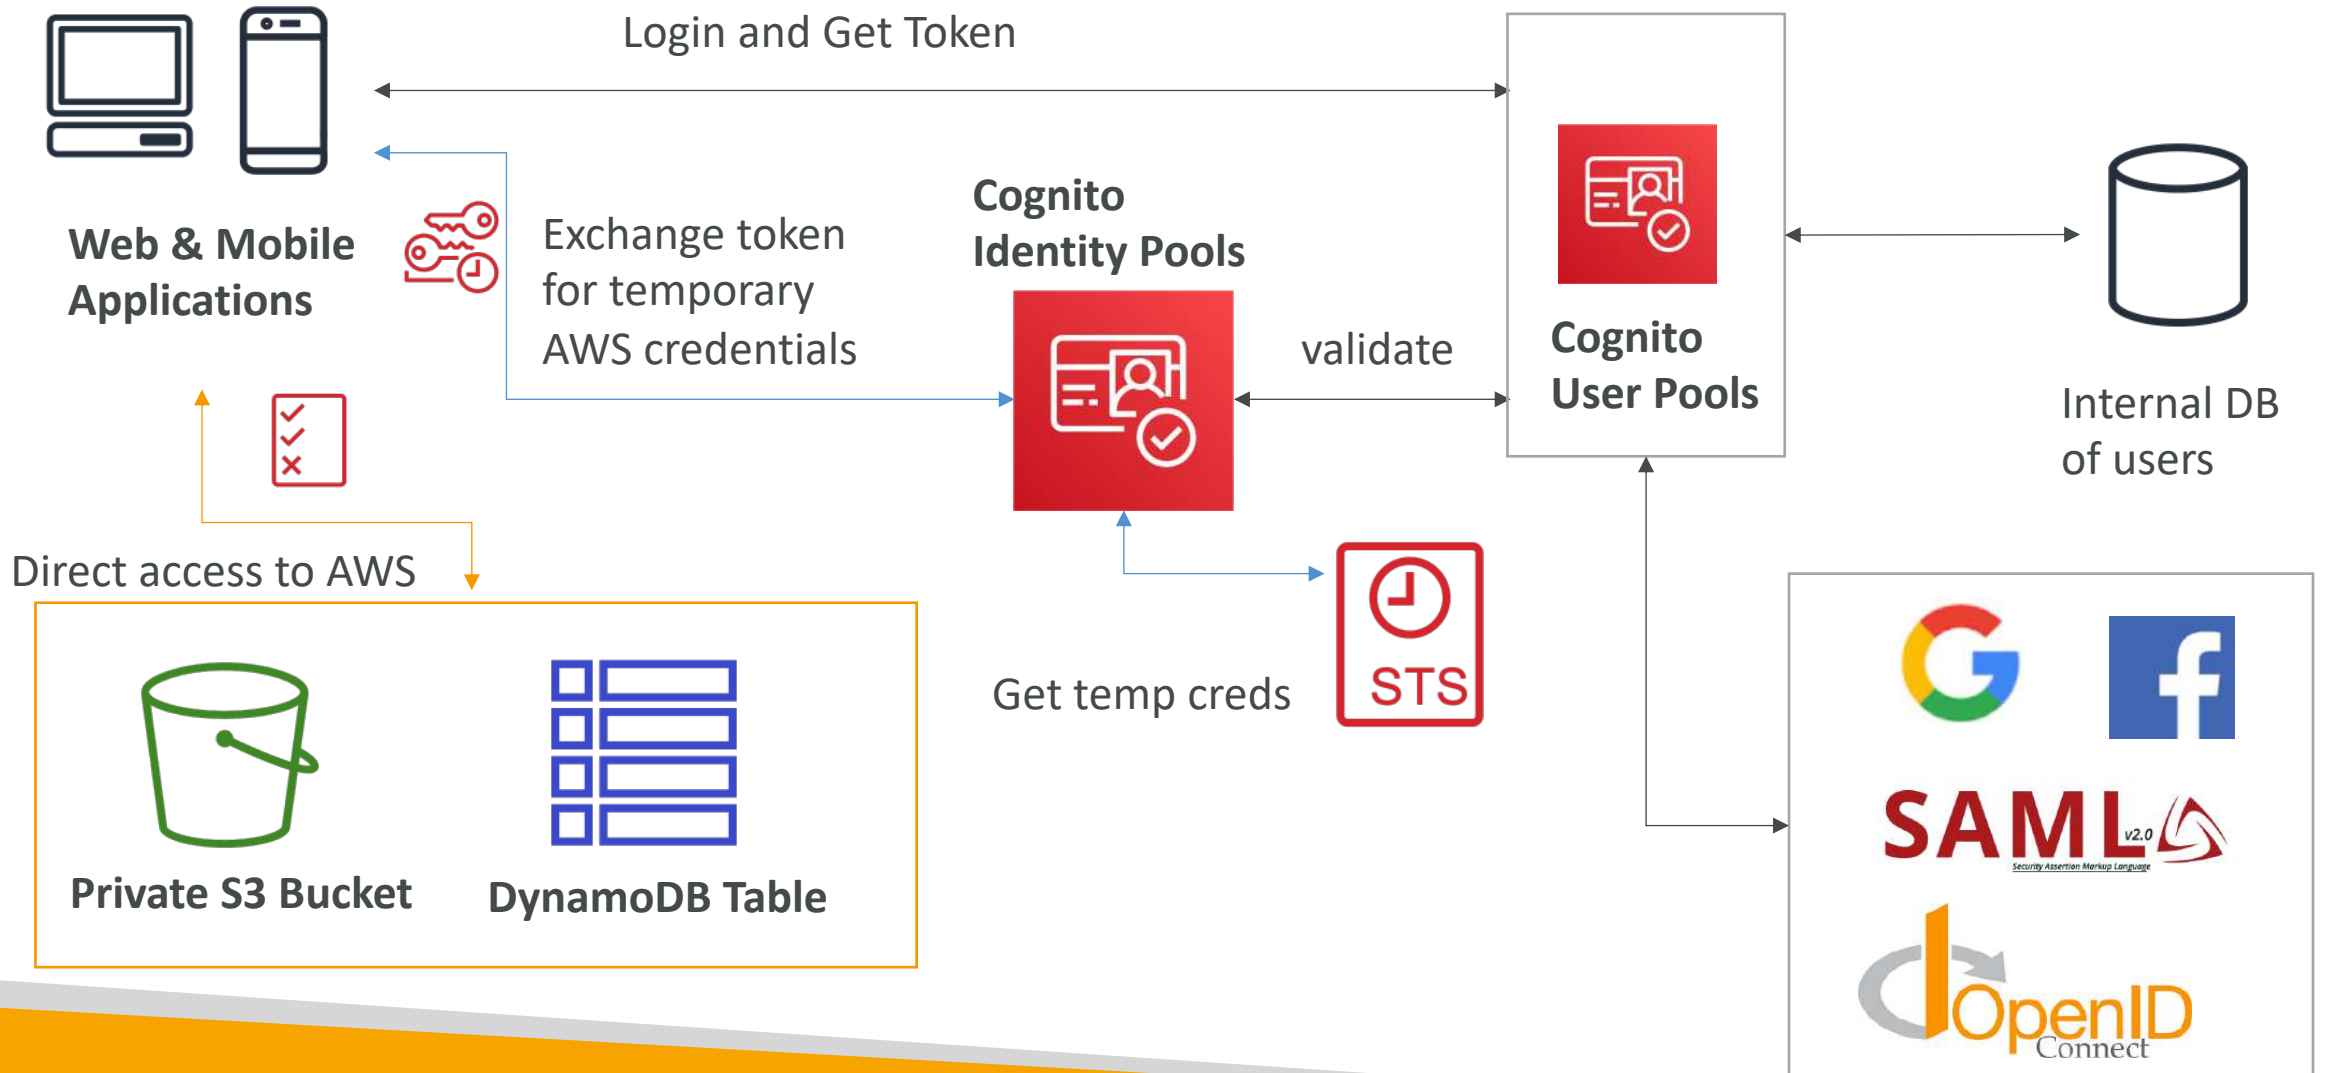

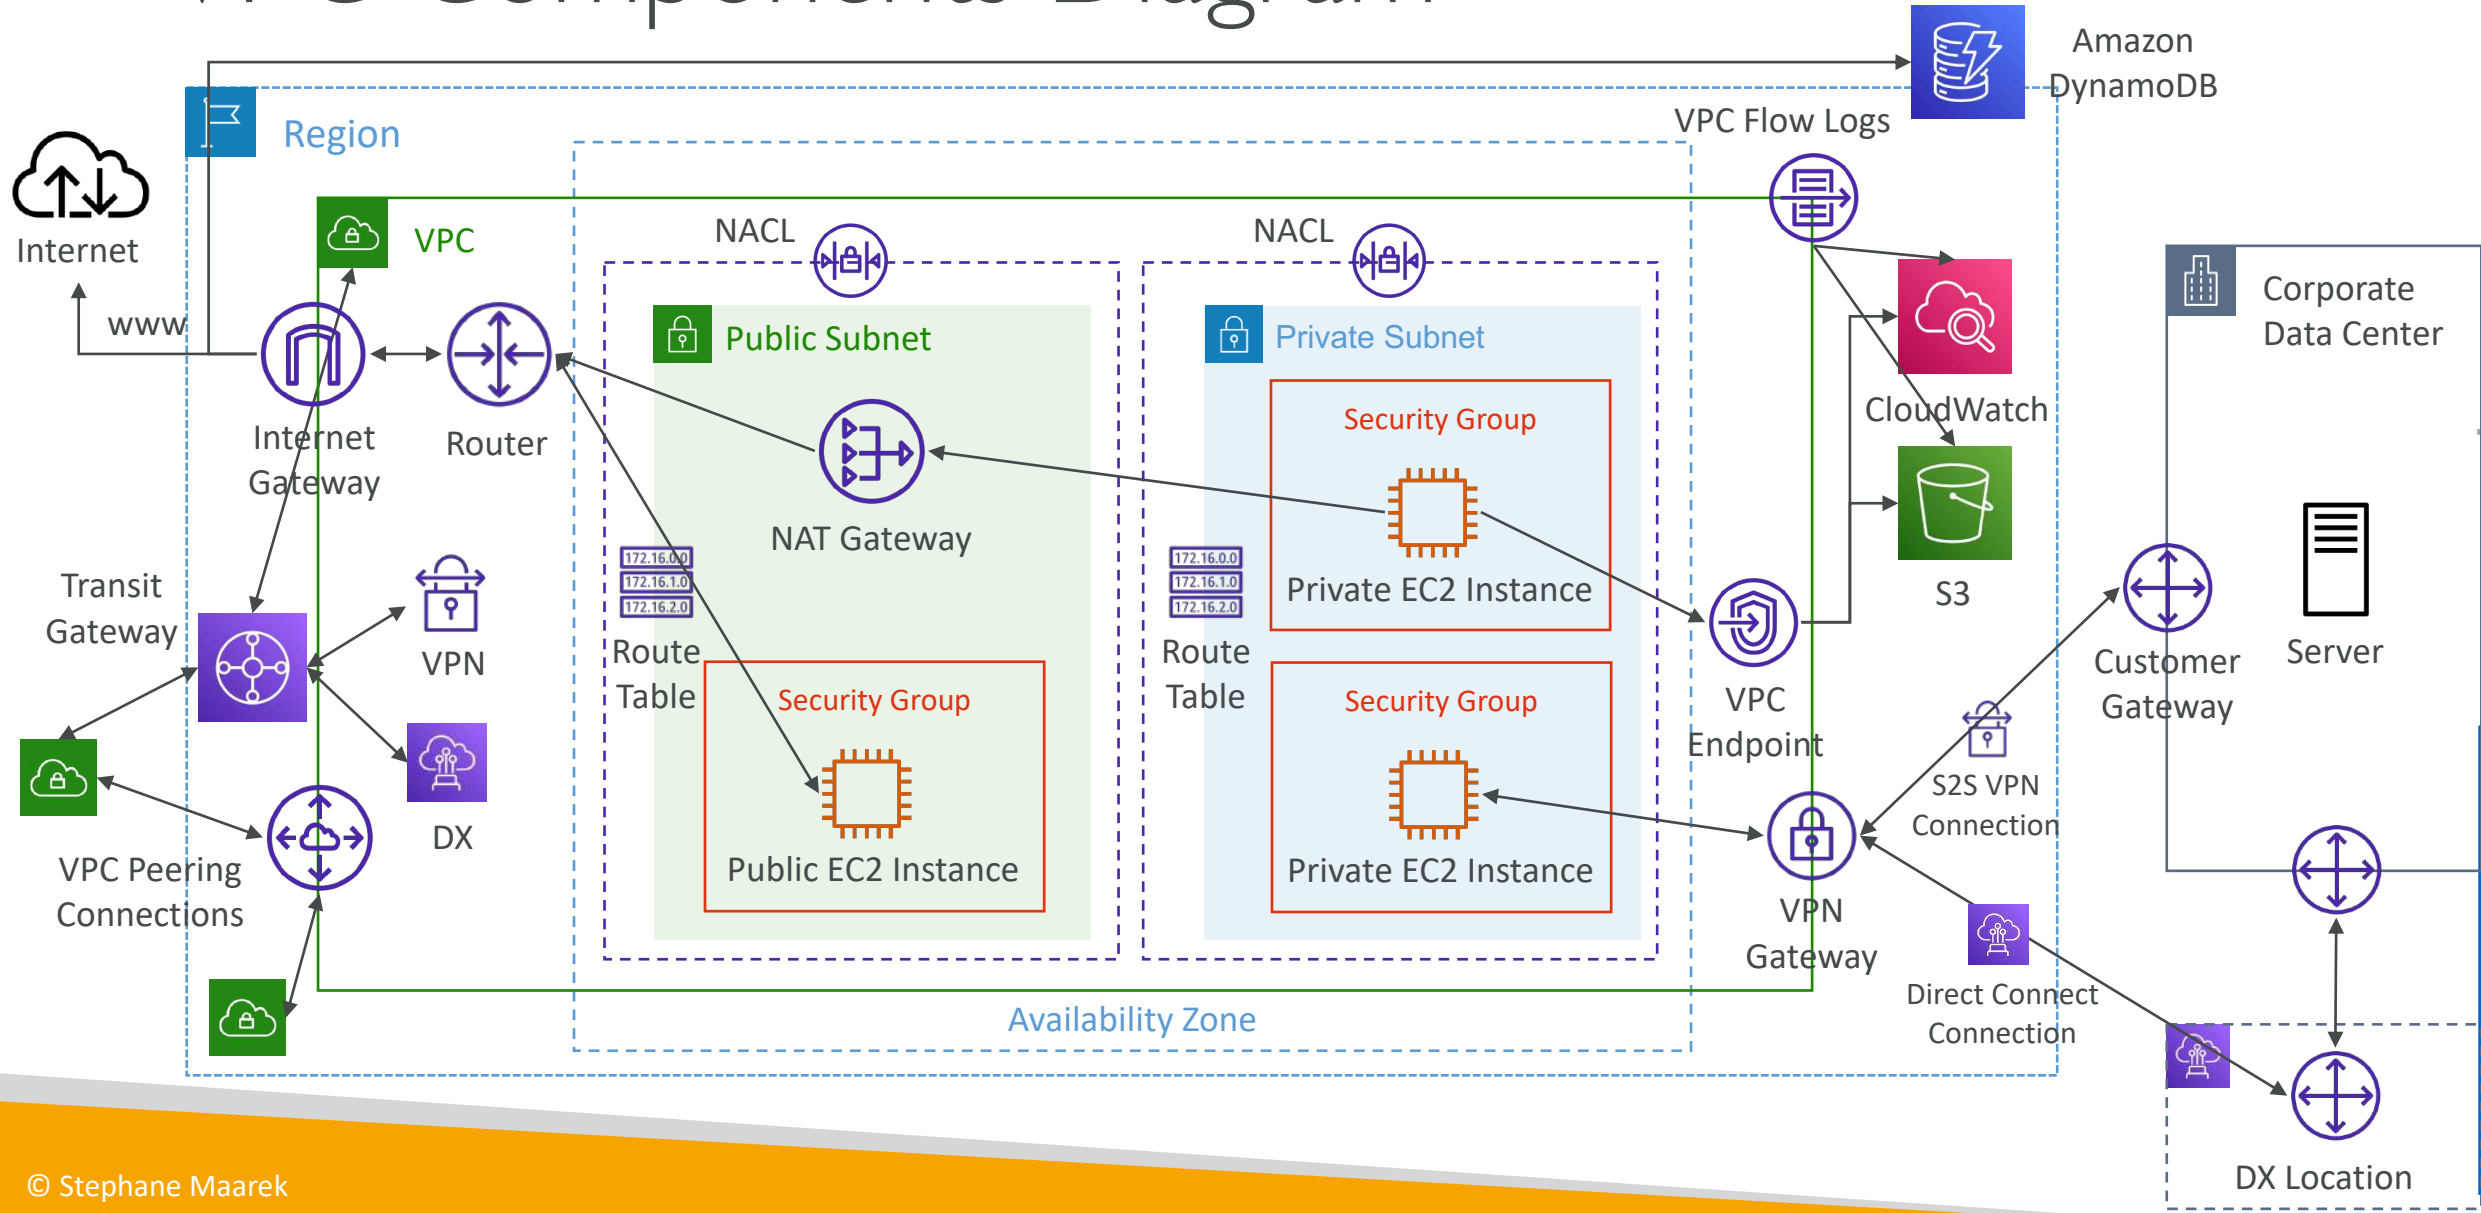

Cognito User Pools vs Identity Pools

- Cognito User Pools (for authentication = identity verification)
  - Database of users for your web and mobile application
  - Allows to federate logins through Public Social, OIDC, SAML…
  - Can customize the hosted UI for authentication (including the logo)
  - Has triggers with AWS Lambda during the authentication flow
  - Adapt the sign-in experience to different risk levels (MFA, adaptive authentication, etc…)
- Cognito Identity Pools (for authorization = access control)
  - Obtain AWS credentials for your users
  - Users can login through Public Social, OIDC, SAML & Cognito User Pools
  - Users can be unauthenticated (guests)
  - Users are mapped to IAM roles & policies, can leverage policy variables
- CUP + CIP = authentication + authorization

Understanding CIDR – IPv4

- **Classless Inter-Domain Routing** – a method for allocating IP addresses
- Used in **Security Groups** rules and AWS networking in general

IP version	Type	Protocol	Port range	Source	Description
IPv4	SSH	TCP	22	122.149.196.85/32	–
IPv4	HTTP	TCP	80	0.0.0.0/0	–

- They help to define an IP address range:
  - We've seen WW.XX.YY.ZZ**/32** => one IP
  - We've seen 0.0.0.0**/0** => all IPs
  - But we can define: 192.168.0.0**/26** => 192.168.0.0 – 192.168.0.63 (64 IP addresses)

Understanding CIDR – IPv4

- A CIDR consists of two components
- Base IP
  - Represents an IP contained in the range (XX.XX.XX.XX)
  - Example: 10.0.0.0, 192.168.0.0, …

- Subnet Mask
  - Defines how many bits can change in the IP
  - Example: /0, /24, /32
  - Can take two forms:
    - /8 ⇔ 255.0.0.0
    - /16 ⇔ 255.255.0.0
    - /24 ⇔ 255.255.255.0
    - /32 ⇔ 255.255.255.255

Understanding CIDR – Subnet Mask

- The Subnet Mask basically allows part of the underlying IP to get additional next values from the base IP

| 192 | . | 168 | . | 0 | . | 0 | **/32** => allows for **1** IP (2^0) $\longrightarrow$ 192.168.0.0 |

| 192 | . | 168 | . | 0 | . | 0 | **/31** => allows for **2** IP (2^1) $\longrightarrow$ 192.168.0.0 -> 192.168.0.1 |

| 192 | . | 168 | . | 0 | . | 0 | **/30** => allows for **4** IP (2^2) $\longrightarrow$ 192.168.0.0 -> 192.168.0.3 |

| 192 | . | 168 | . | 0 | . | 0 | **/29** => allows for **8** IP (2^3) $\longrightarrow$ 192.168.0.0 -> 192.168.0.7 |

| 192 | . | 168 | . | 0 | . | 0 | **/28** => allows for **16** IP (2^4) $\longrightarrow$ 192.168.0.0 -> 192.168.0.15 |

| 192 | . | 168 | . | 0 | . | 0 | **/27** => allows for **32** IP (2^5) $\longrightarrow$ 192.168.0.0 -> 192.168.0.31 |

| 192 | . | 168 | . | 0 | . | 0 | **/26** => allows for **64** IP (2^6) $\longrightarrow$ 192.168.0.0 -> 192.168.0.63 |

| 192 | . | 168 | . | 0 | . | 0 | **/25** => allows for **128** IP (2^7) $\longrightarrow$ 192.168.0.0 -> 192.168.0.127 |

| 192 | . | 168 | . | 0 | . | 0 | **/24** => allows for **256** IP (2^8) $\longrightarrow$ 192.168.0.0 -> 192.168.0.255 |

…

| 192 | . | 168 | . | 0 | . | 0 | **/16** => allows for **65,536** IP (2^{16}) $\longrightarrow$ 192.168.0.0 -> 192.168.255.255 |

…

| 192 | . | 168 | . | 0 | . | 0 | **/0** => allows for **All IPs** $\longrightarrow$ 0.0.0.0 -> 255.255.255.255 |

Quick Memo

Octets

1st . 2nd . 3rd . 4th

- **/32** – no octet can change
- **/24** – last octet can change
- **/16** – last 2 octets can change
- **/8** – last 3 octets can change
- **/0** – all octets can change

Understanding CIDR – Little Exercise

- 192.168.0.0/24 = … ?
  - 192.168.0.0 – 192.168.0.255 (256 IPs)
- 192.168.0.0/16 = … ?
  - 192.168.0.0 – 192.168.255.255 (65,536 IPs)
- 134.56.78.123/32 = … ?
  - Just 134.56.78.123
- 0.0.0.0/0
  - All IPs!

- When in doubt, use this website https://www.ipaddressguide.com/cidr

Public vs. Private IP (IPv4)

- The Internet Assigned Numbers Authority (IANA) established certain blocks of IPv4 addresses for the use of private (LAN) and public (Internet) addresses

- **Private IP** can only allow certain values:
  - 10.0.0.0 – 10.255.255.255 (10.0.0.0/8) ← in big networks
  - 172.16.0.0 – 172.31.255.255 (172.16.0.0/12) ← AWS default VPC in that range
  - 192.168.0.0 – 192.168.255.255 (192.168.0.0/16) ← e.g., home networks

- All the rest of the IP addresses on the Internet are Public

Default VPC Walkthrough

- All new AWS accounts have a default VPC

- New EC2 instances are launched into the default VPC if no subnet is specified

- Default VPC has Internet connectivity and all EC2 instances inside it have public IPv4 addresses

- We also get a public and a private IPv4 DNS names

VPC in AWS – IPv4

- VPC = Virtual Private Cloud
- You can have multiple VPCs in an AWS region (max. 5 per region – soft limit)
- Max. CIDR per VPC is 5, for each CIDR:
  - Min. size is /28 (16 IP addresses)
  - Max. size is /16 (65536 IP addresses)
- Because VPC is private, only the Private IPv4 ranges are allowed:
  - 10.0.0.0 – 10.255.255.255 (10.0.0.0/8)
  - 172.16.0.0 – 172.31.255.255 (172.16.0.0/12)
  - 192.168.0.0 – 192.168.255.255 (192.168.0.0/16)

- <u>Your VPC CIDR should NOT overlap with your other networks (e.g., corporate)</u>

State of Hands-on
Adding Subnets
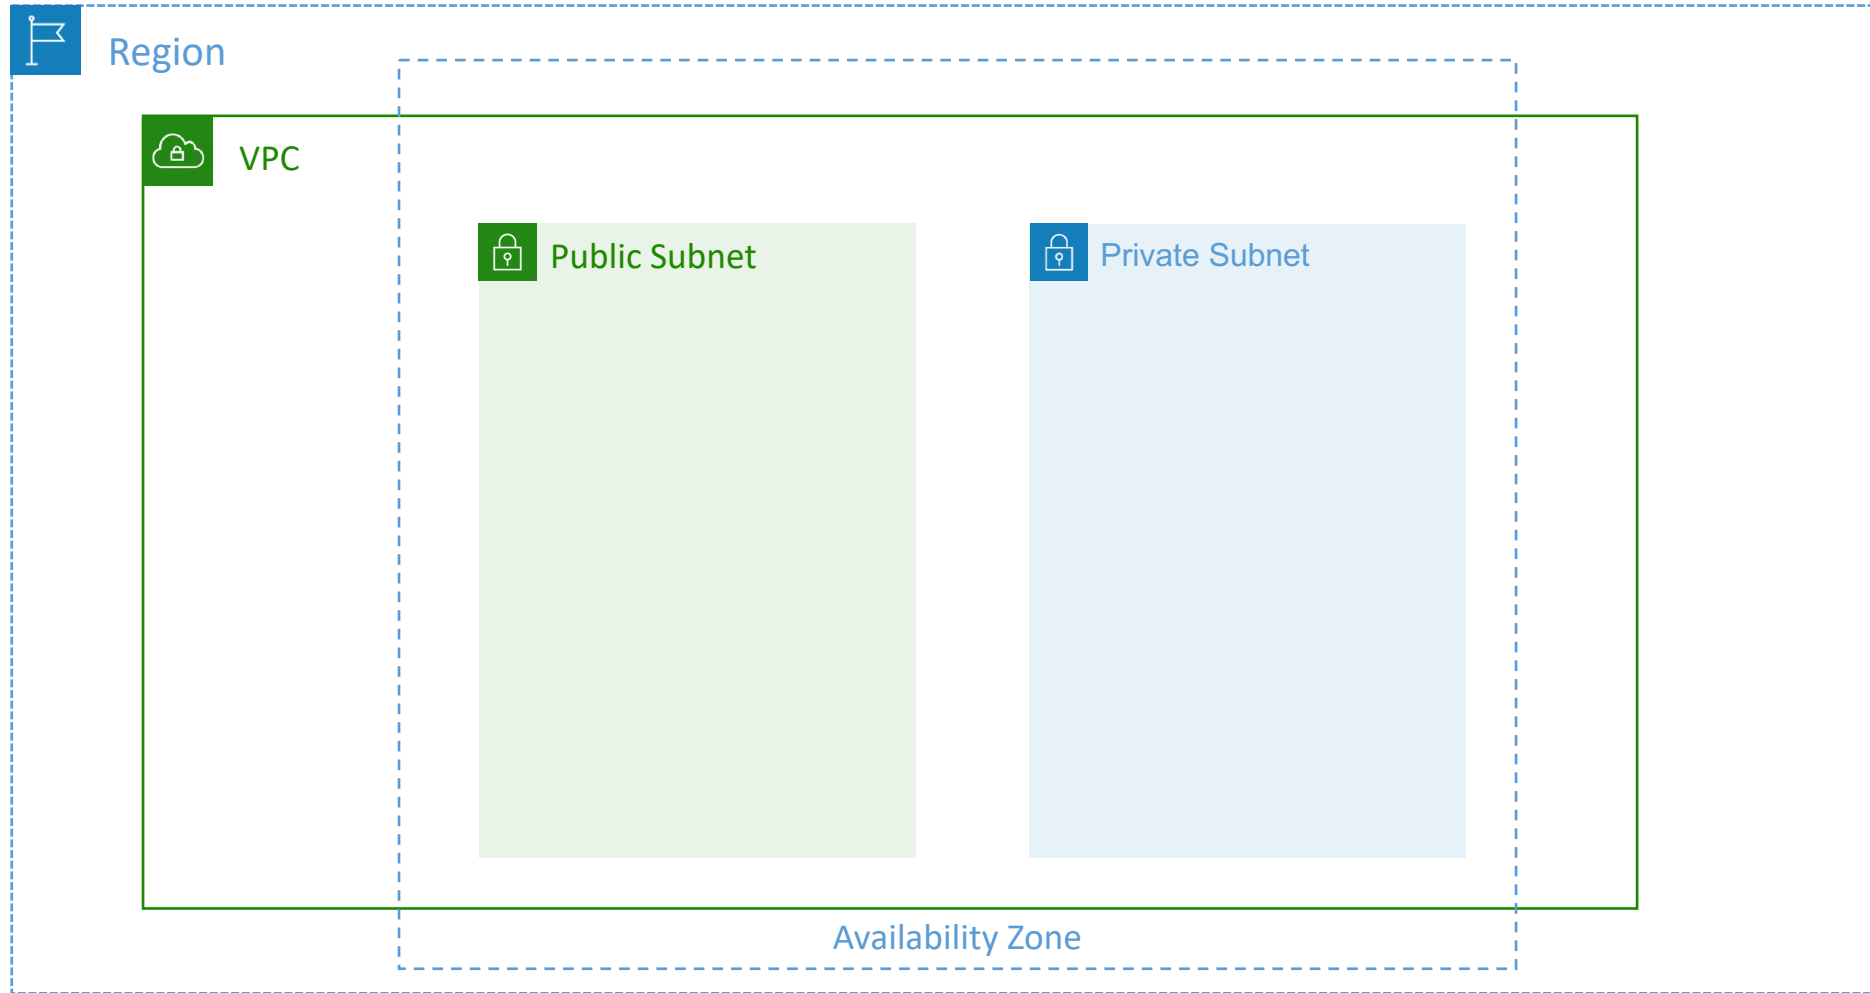

VPC – Subnet (IPv4)

- AWS reserves **5 IP addresses (first 4 & last 1)** in each subnet
- These 5 IP addresses are not available for use and can't be assigned to an EC2 instance
- Example: if CIDR block 10.0.0.0/24, then reserved IP addresses are:
  - 10.0.0.0 – Network Address
  - 10.0.0.1 – reserved by AWS for the VPC router
  - 10.0.0.2 – reserved by AWS for mapping to Amazon-provided DNS
  - 10.0.0.3 – reserved by AWS for future use
  - 10.0.0.255 – Network Broadcast Address. AWS does not support broadcast in a VPC, therefore the address is reserved

- <u>Exam Tip,</u> if you need 29 IP addresses for EC2 instances:
  - You can't choose a subnet of size /27 (32 IP addresses, 32 – 5 = 27 < 29)
 - You need to choose a subnet of size /26 (64 IP addresses, 64 – 5 = 59 > 29)

Internet Gateway (IGW)

- Allows resources (e.g., EC2 instances) in a VPC connect to the Internet

- It scales horizontally and is highly available and redundant

- Must be created separately from a VPC

- One VPC can only be attached to one IGW and vice versa

- Internet Gateways on their own do not allow Internet access…

- Route tables must also be edited!
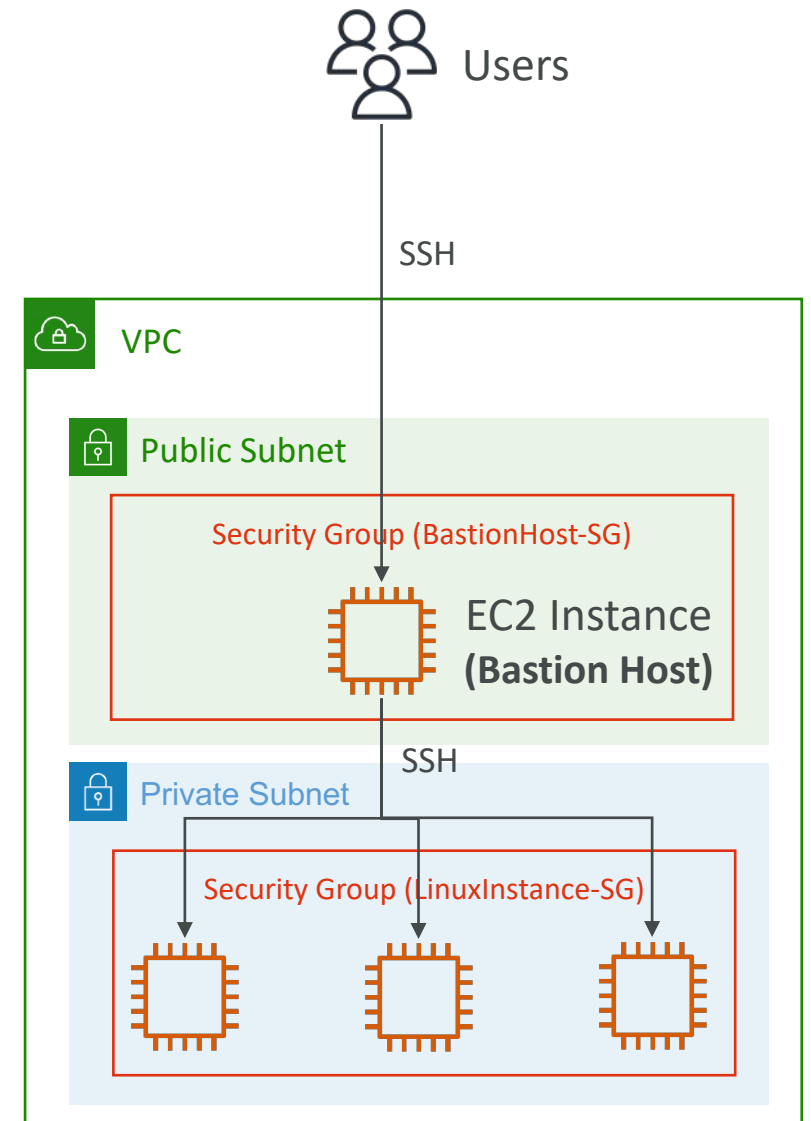

# Adding Internet Gateway
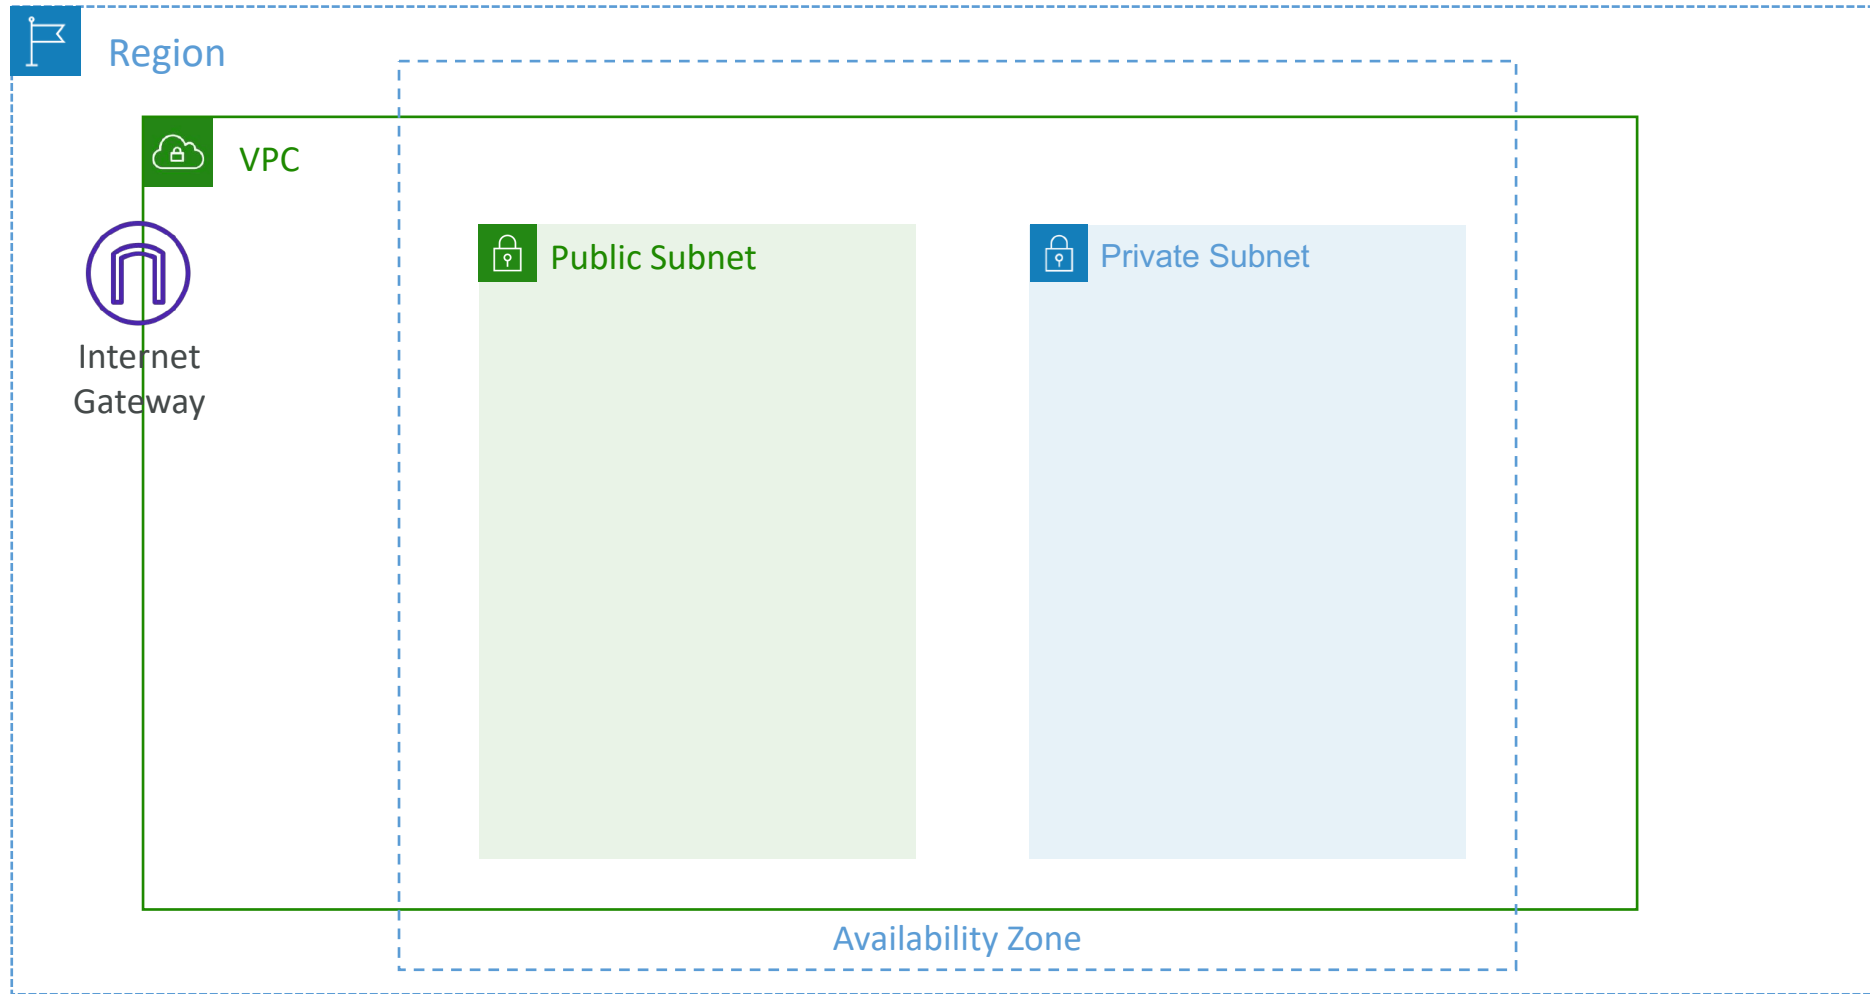

Editing Route Tables
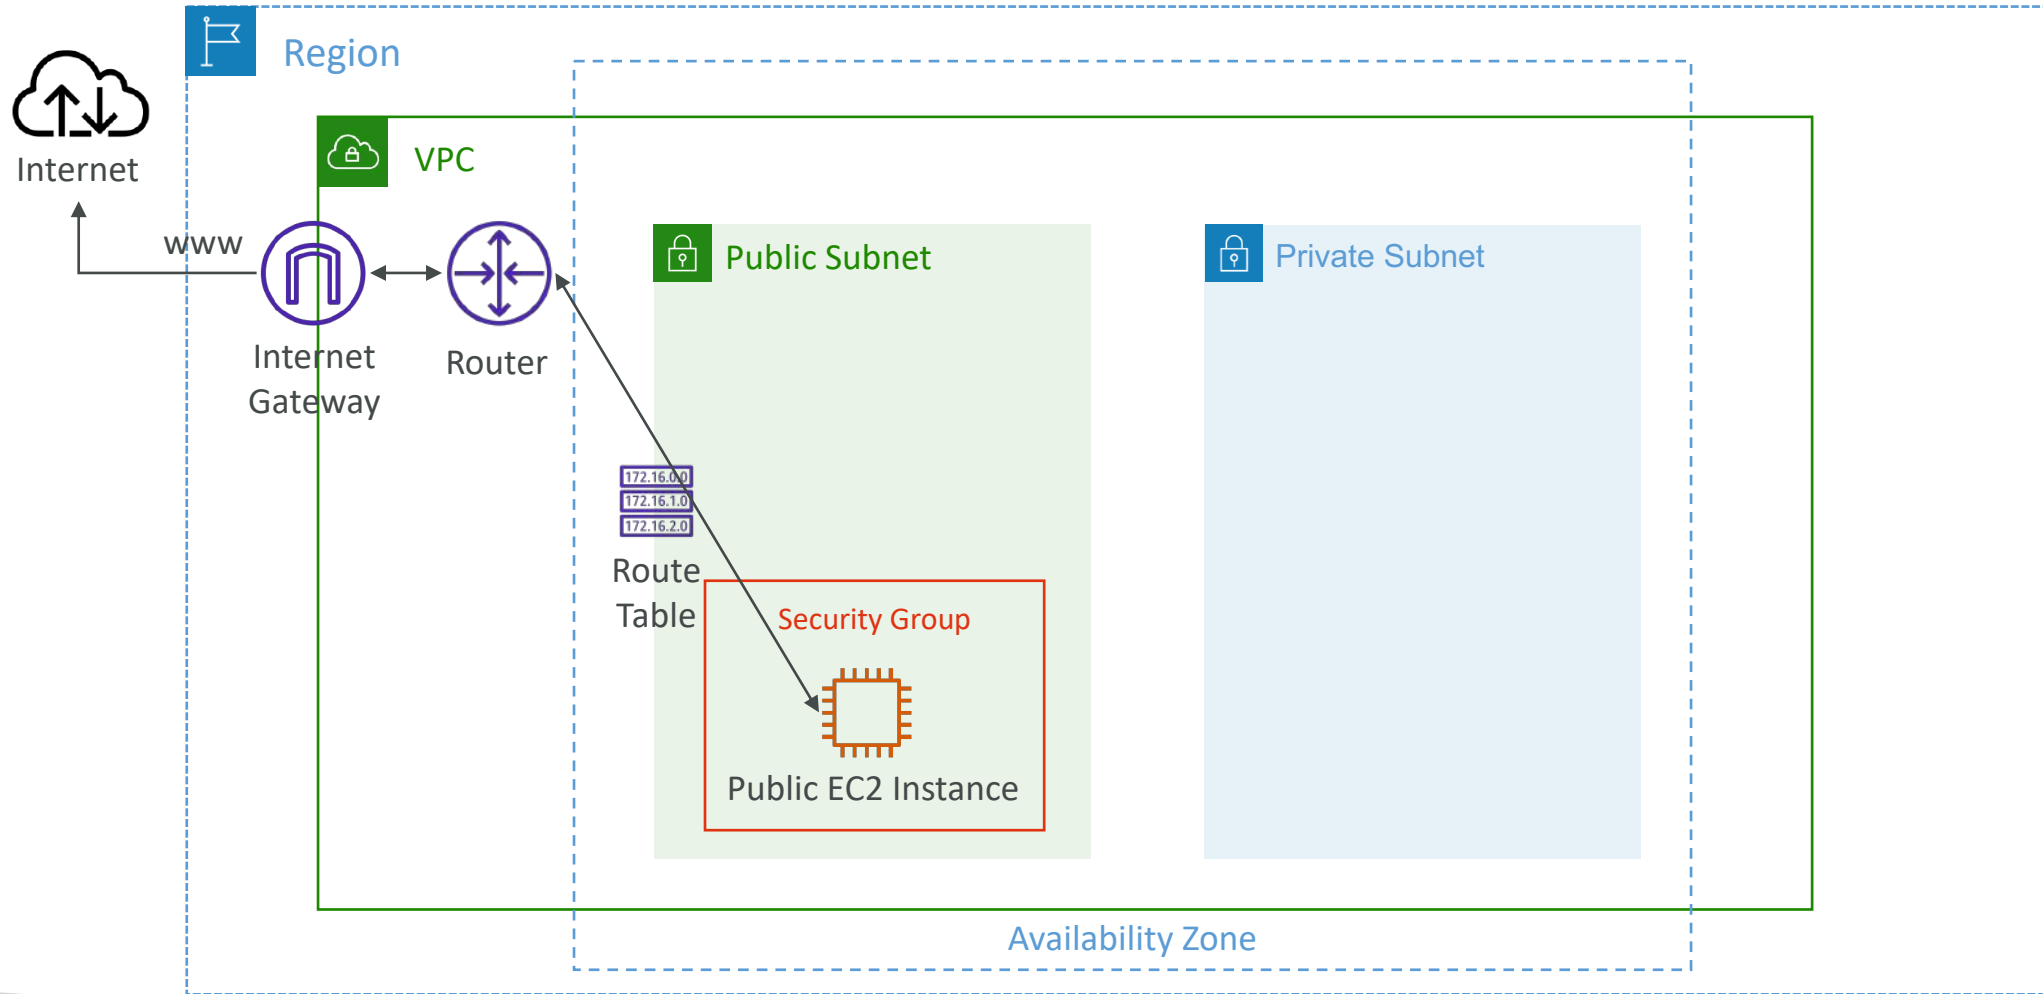

Bastion Hosts

- We can use a Bastion Host to SSH into our private EC2 instances

- The bastion is in the public subnet which is then connected to all other private subnets

- **Bastion Host security group must allow** inbound from the internet on port 22 from restricted CIDR, for example the <u>public CIDR</u> of your corporation

- **Security Group of the EC2 Instances** must allow the Security Group of the Bastion Host, or the <u>private IP</u> of the Bastion host
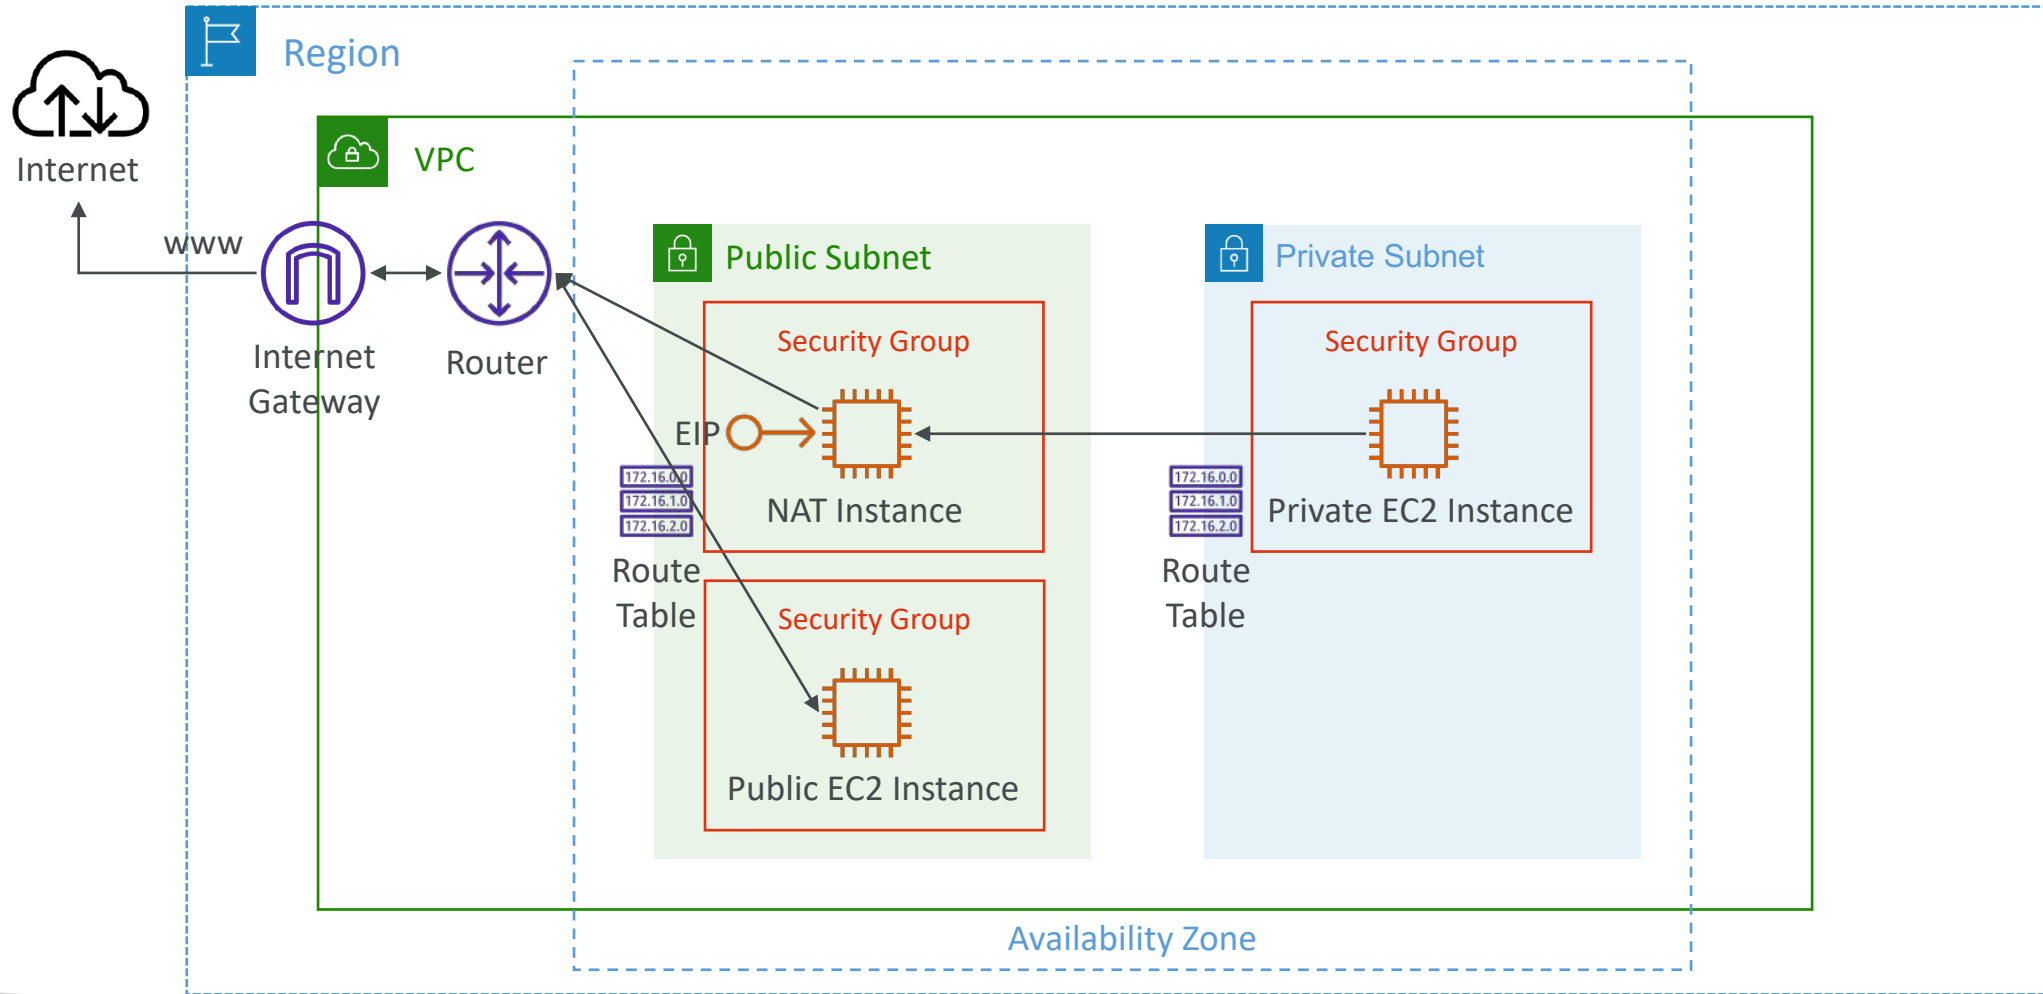

Users

SSH

VPC

Public Subnet

Security Group (BastionHost-SG)

EC2 Instance
(Bastion Host)

SSH

Private Subnet

Security Group (LinuxInstance-SG)

NAT Instance (**outdated**, but still at the exam)

- NAT = Network Address Translation

- Allows EC2 instances in private subnets to connect to the Internet

- Must be launched in a public subnet

- Must disable EC2 setting: **Source / destination Check**

- Must have Elastic IP attached to it

- Route Tables must be configured to route traffic from private subnets to the NAT Instance

# NAT Instance

NAT Instance – Comments

- Pre-configured Amazon Linux AMI is available
  - Reached the end of standard support on December 31, 2020
- Not highly available / resilient setup out of the box
  - You need to create an ASG in multi-AZ + resilient user-data script
- Internet traffic bandwidth depends on EC2 instance type
- You must manage Security Groups & rules:
  - Inbound:
    - Allow HTTP / HTTPS traffic coming from Private Subnets
    - Allow SSH from your home network (access is provided through Internet Gateway)
  - Outbound:
   - Allow HTTP / HTTPS traffic to the Internet

NAT Gateway
- AWS-managed NAT, higher bandwidth, high availability, no administration
- Pay per hour for usage and bandwidth
- NATGW is created in a specific Availability Zone, uses an Elastic IP
- Can't be used by EC2 instance in the same subnet (only from other subnets)
- Requires an IGW (Private Subnet => NATGW => IGW)
- 5 Gbps of bandwidth with automatic scaling up to 100 Gbps
- No Security Groups to manage / required

NAT Gateway
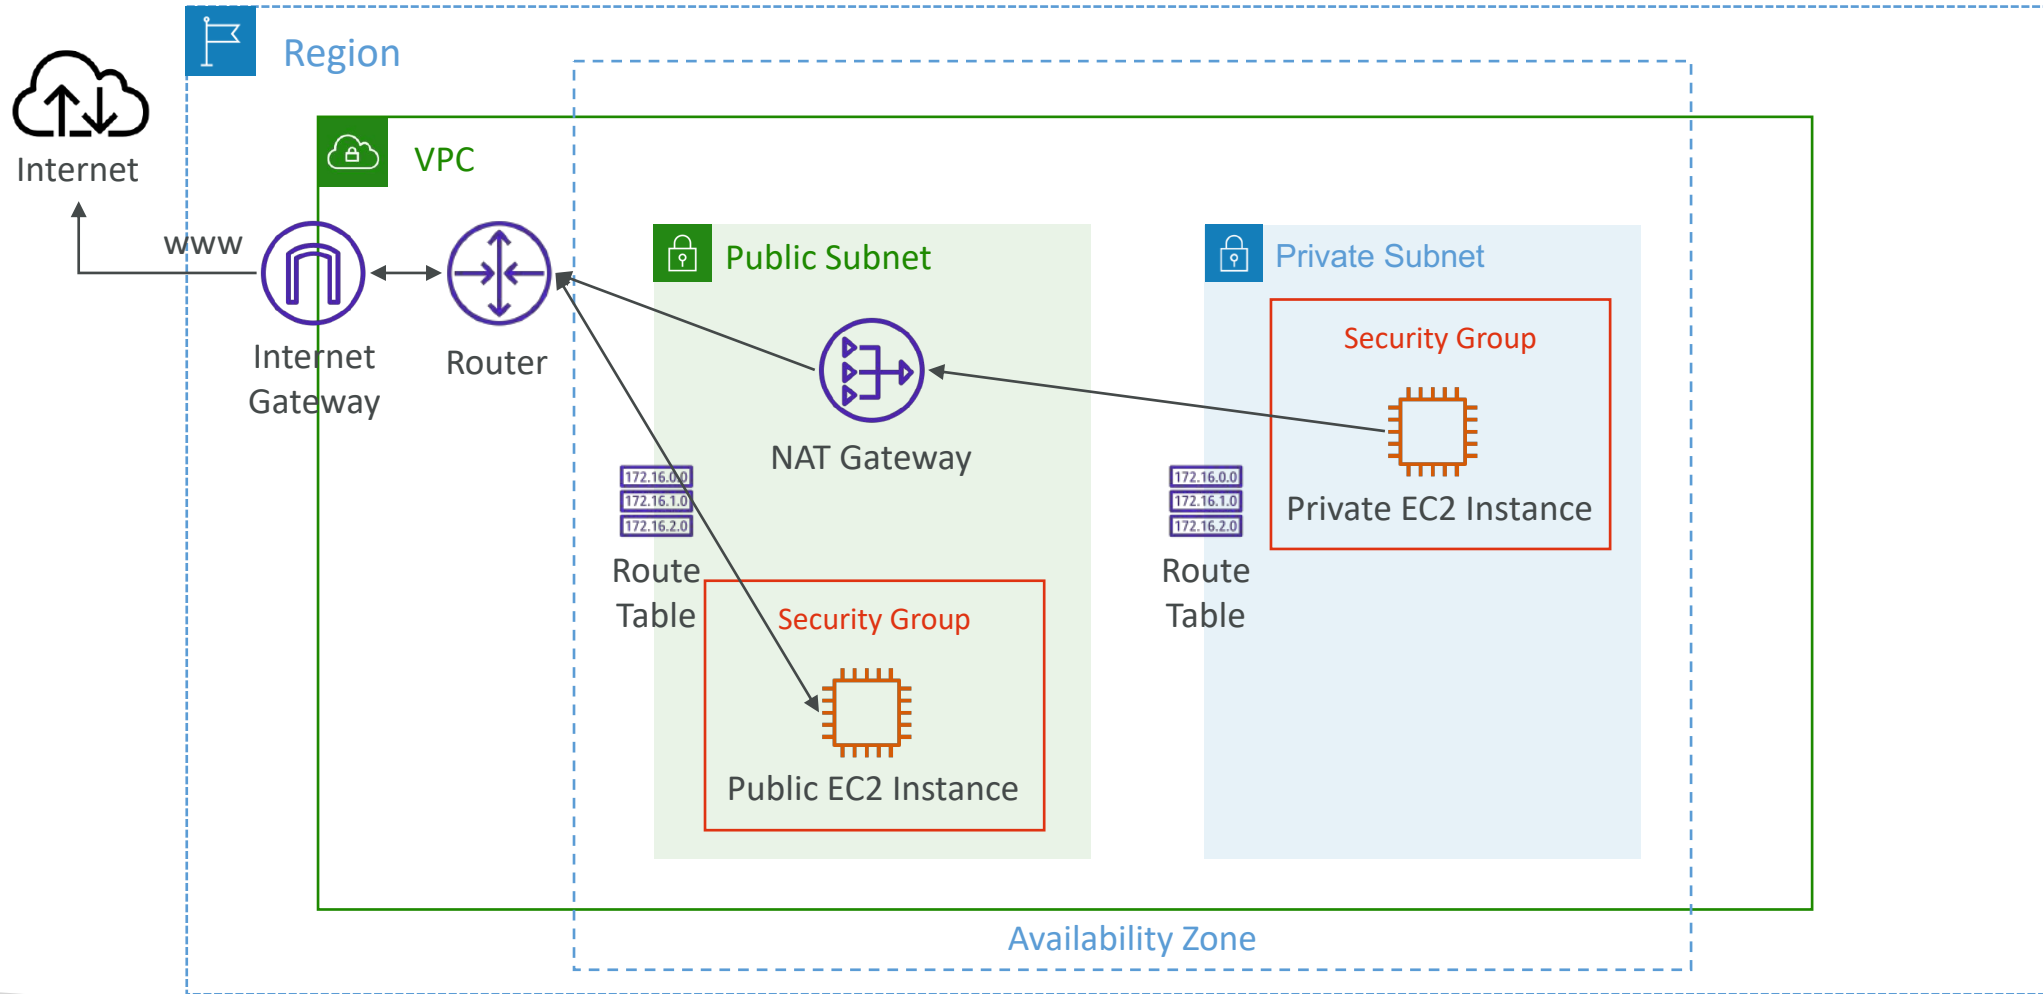

NAT Gateway with High Availability

- NAT Gateway is resilient within a single Availability Zone

- Must create **multiple NAT Gateways** in **multiple AZs** for fault-tolerance

- There is no cross-AZ failover needed because if an AZ goes down it doesn't need NAT
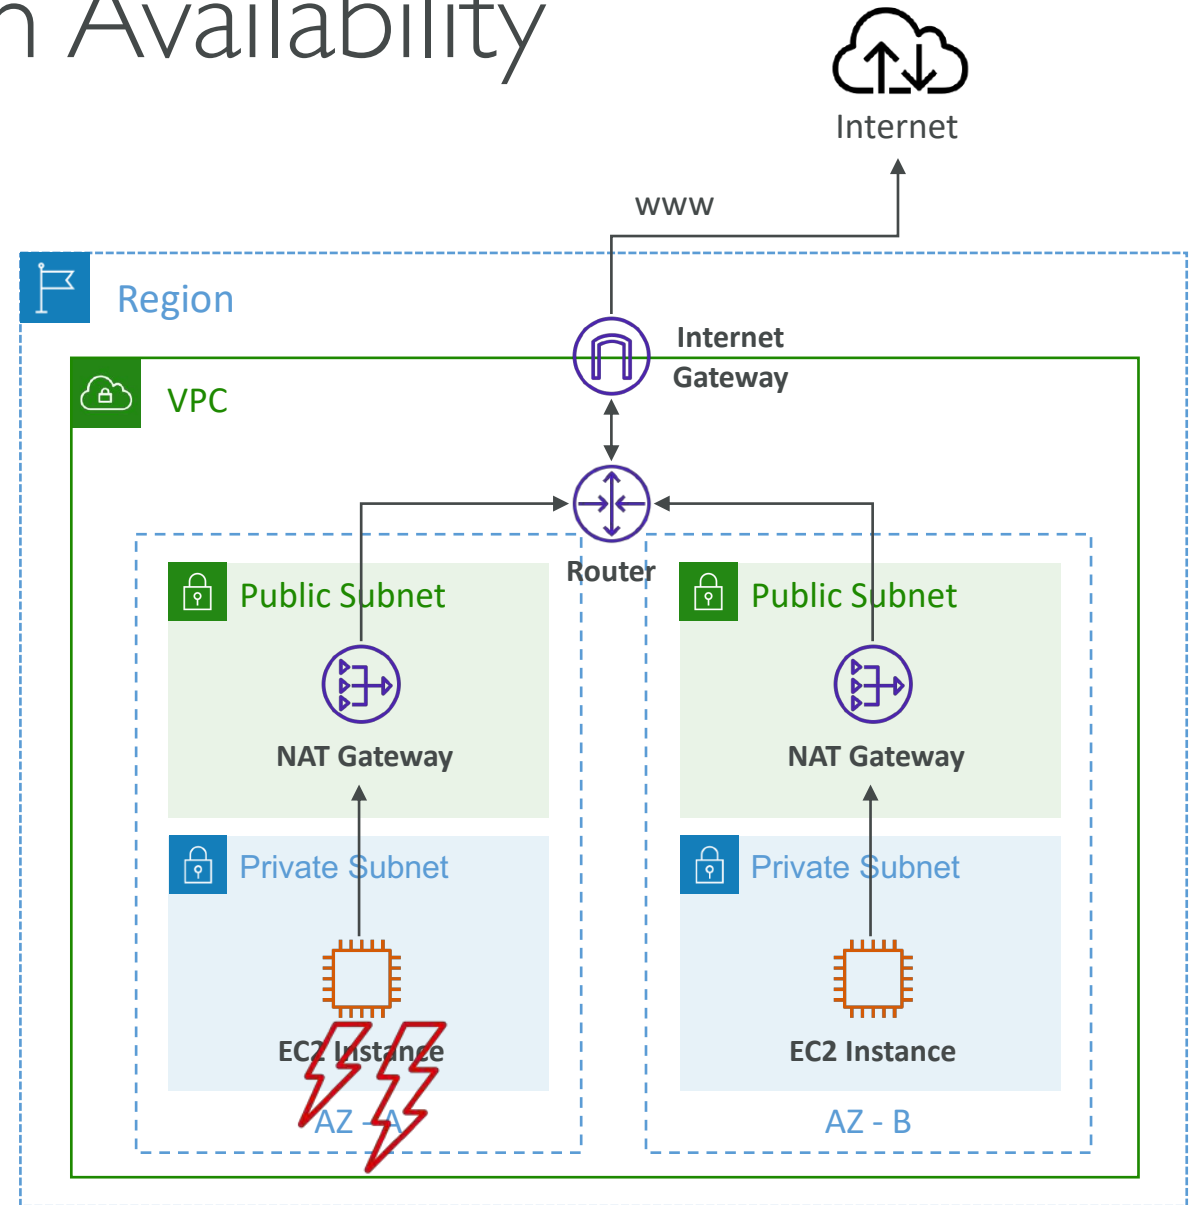

NAT Gateway vs. NAT Instance

	NAT Gateway	NAT Instance
Availability	Highly available within AZ (create in another AZ)	Use a script to manage failover between instances
Bandwidth	Up to 100 Gbps	Depends on EC2 instance type
Maintenance	Managed by AWS	Managed by you (e.g., software, OS patches, …)
Cost	Per hour & amount of data transferred	Per hour, EC2 instance type and size, + network $
Public IPv4	✔	✔
Private IPv4	✔	✔
Security Groups	✘	✔
Use as Bastion Host?	✘	✔

More at: https://docs.aws.amazon.com/vpc/latest/userguide/vpc-nat-comparison.html
DNS Resolution in VPC

- DNS Resolution (enableDnsSupport)
  - Decides if DNS resolution from Route 53 Resolver server is supported for the VPC
  - True (default): it queries the Amazon Provider DNS Server at 169.254.169.253 or the reserved IP address at the base of the **VPC IPv4 network range plus two (.2)**
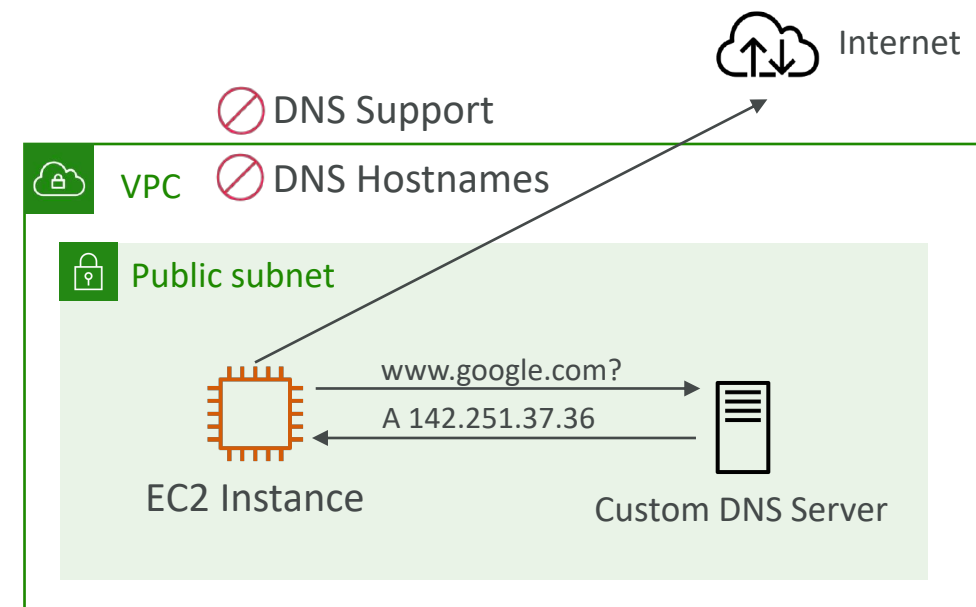

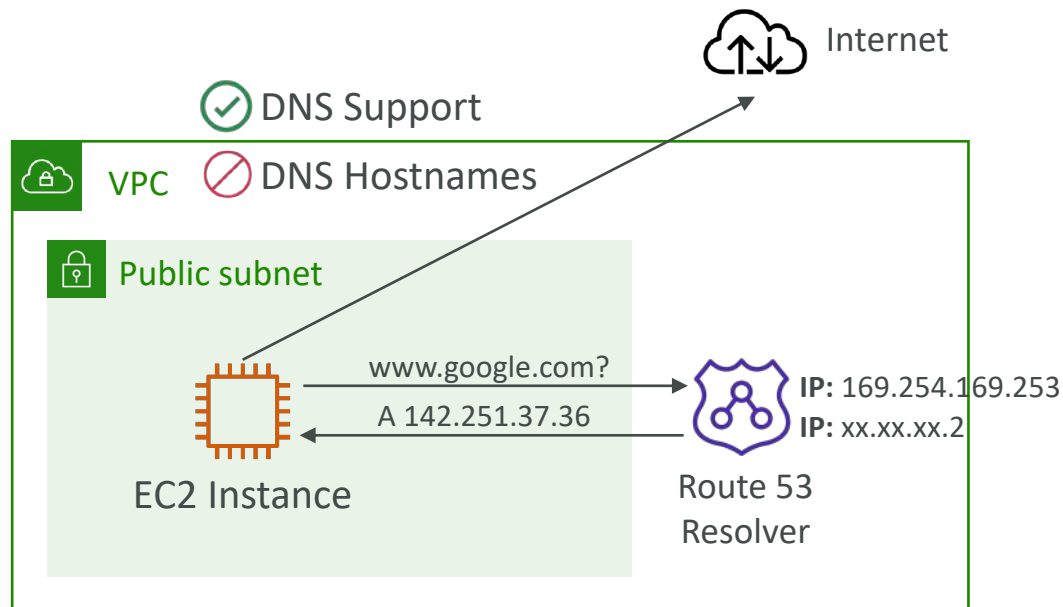

DNS Resolution in VPC

- DNS Hostnames (enableDnsHostnames)
  - By default,
    - True => default VPC
    - False => newly created VPCs
  - Won't do anything unless enableDnsSupport=true
  - If True, assigns public hostname to EC2 instance if it has a public IPv4

✓ DNS Support

VPC ⊘ DNS Hostnames

🔒 Public subnet

EC2 Instance
(**Private DNS:** ip-*private-ipv4-address*.ec2.internal)

✓ DNS Support

VPC ✓ DNS Hostnames

🔒 Public subnet

EC2 Instance
(**Private DNS:** ip-*private-ipv4-address*.ec2.internal)
(**Public DNS:** ec2-*public-ipv4-address*.compute-1.amazonaws.com)

DNS Resolution in VPC

- If you use custom DNS domain names in a Private Hosted Zone in Route 53, you must set both these attributes (enableDnsSupport & enableDnsHostname) to true
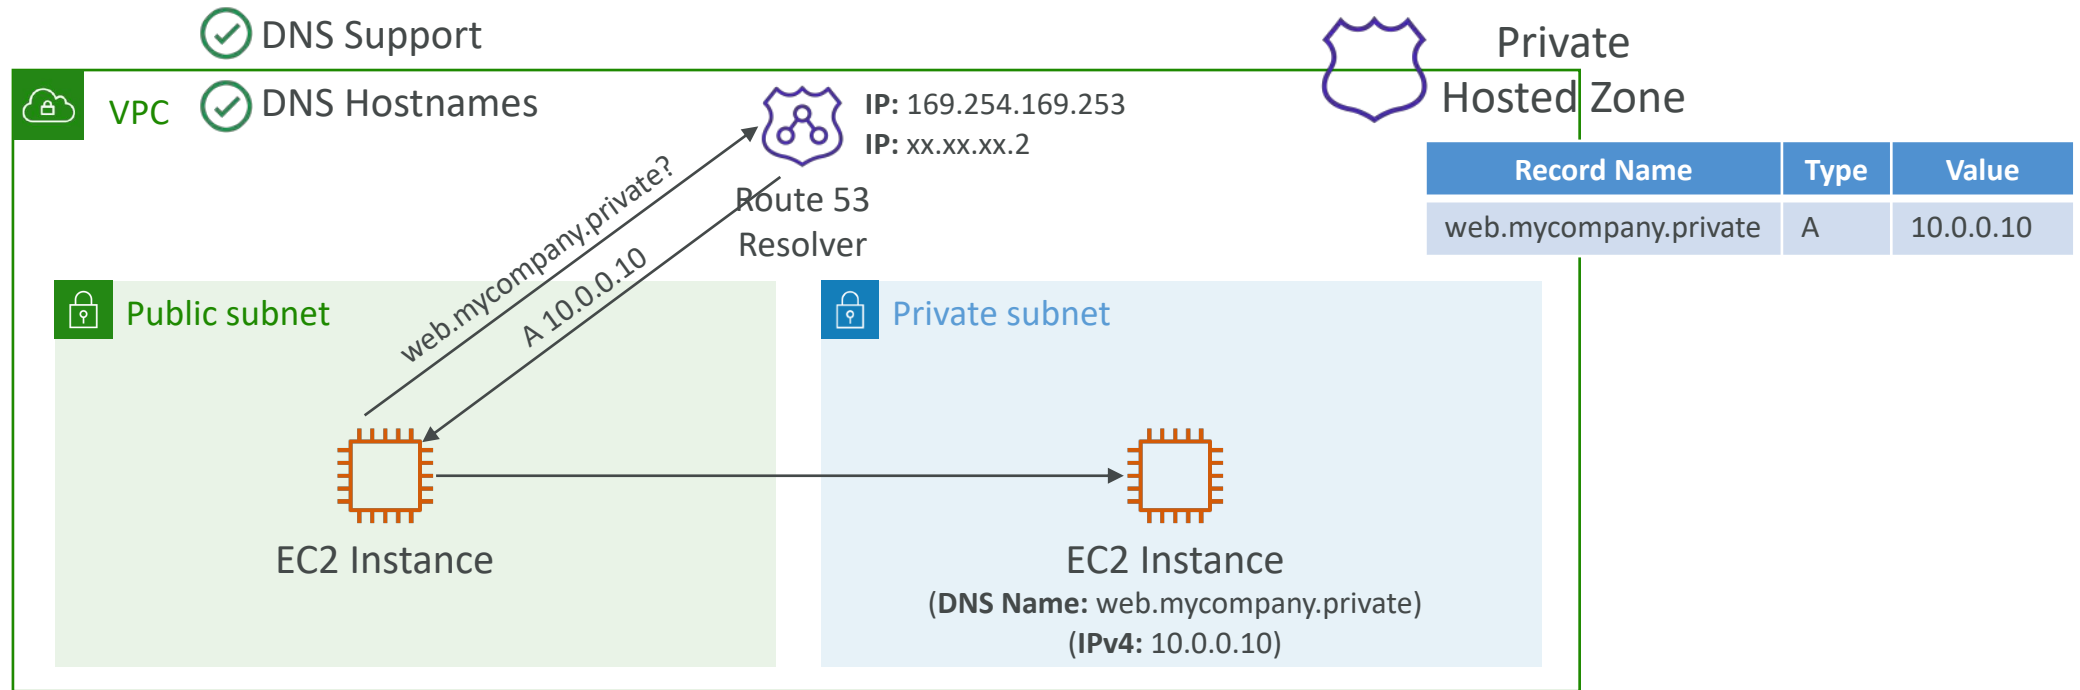

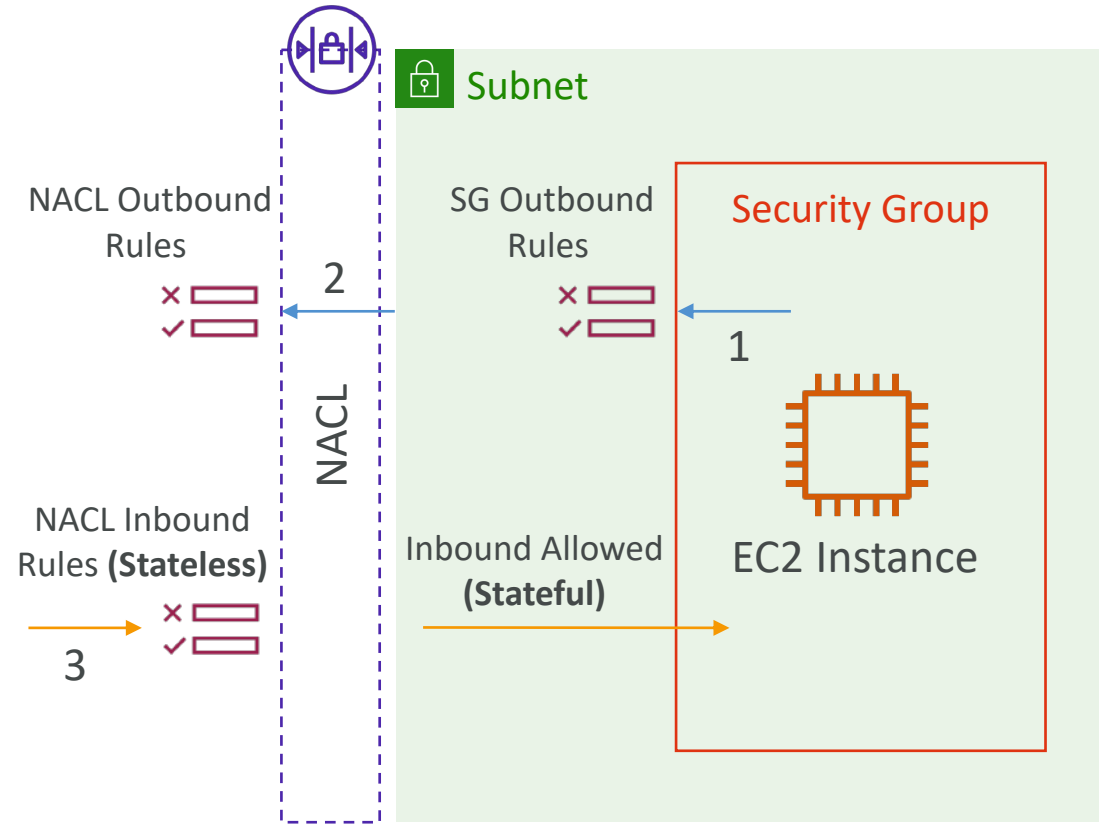

Security Groups & NACLs

Network Access Control List (NACL)

- NACL are like a firewall which control traffic from and to **subnets**

- **One NACL per subnet,** new subnets are assigned the **Default NACL**

- You define **NACL Rules:**
  - Rules have a number (1-32766), higher precedence with a lower number
  - First rule match will drive the decision
  - Example: if you define #100 ALLOW 10.0.0.10/32 and #200 DENY 10.0.0.10/32, the IP address will be allowed because 100 has a higher precedence over 200
  - The last rule is an asterisk (*) and denies a request in case of no rule match
  - AWS recommends adding rules by increment of 100

- Newly created NACLs will deny everything

- NACL are a great way of blocking a specific IP address at the subnet level

NACLs
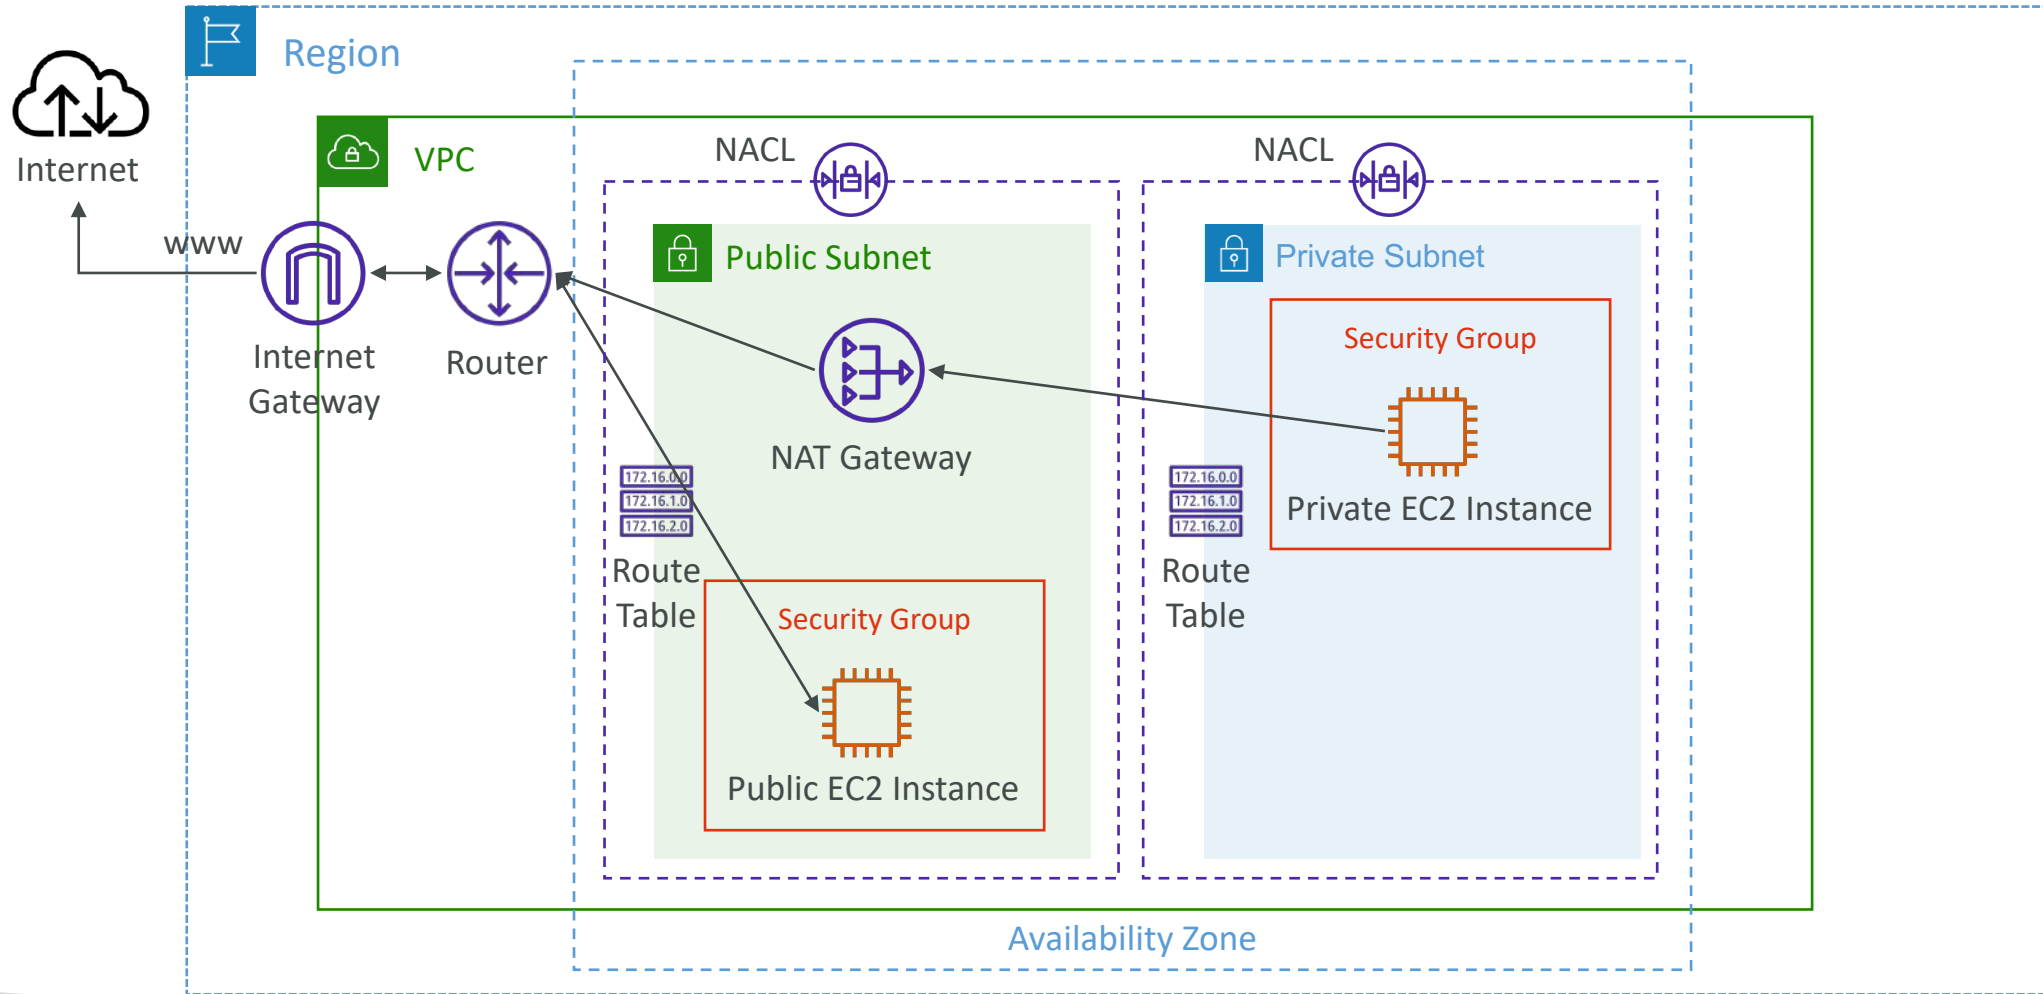

Default NACL

- Accepts everything inbound/outbound with the subnets it's associated with
- Do **NOT** modify the Default NACL, instead create custom NACLs

Default NACL for a VPC that supports IPv4

Inbound Rules

Rule #	Type	Protocol	Port Range	Source	Allow/Deny
100	All IPv4 Traffic	All	All	0.0.0.0/0	ALLOW
*	All IPv4 Traffic	All	All	0.0.0.0/0	DENY

Outbound Rules

Rule #	Type	Protocol	Port Range	Destination	Allow/Deny
100	All IPv4 Traffic	All	All	0.0.0.0/0	ALLOW
*	All IPv4 Traffic	All	All	0.0.0.0/0	DENY

Ephemeral Ports

- For any two endpoints to establish a connection, they must use ports
- Clients connect to a **defined port**, and expect a response on an **ephemeral port**
- Different Operating Systems use different port ranges, examples:
  - IANA & MS Windows 10 ➔ 49152 – 65535
  - Many Linux Kernels ➔ 32768 – 60999

Create NACL rules for each target subnets CIDR
# Security Group vs. NACLs

Security Group	NACL
Operates at the instance level	Operates at the subnet level
Supports allow rules only	Supports allow rules and deny rules
Stateful: return traffic is automatically allowed, regardless of any rules	**Stateless:** return traffic must be explicitly allowed by rules (think of ephemeral ports)
All rules are evaluated before deciding whether to allow traffic	Rules are evaluated in order (lowest to highest) when deciding whether to allow traffic, first match wins
Applies to an EC2 instance when specified by someone	Automatically applies to all EC2 instances in the subnet that it's associated with

NACL Examples: https://docs.aws.amazon.com/vpc/latest/userguide/vpc-network-acls.html
VPC – Reachability Analyzer

- A network diagnostics tool that troubleshoots network connectivity between two endpoints in your VPC(s)

- It builds a model of the network configuration, then checks the reachability based on these configurations **(it doesn't send packets)**

- When the destination is
  - **Reachable** – it produces hop-by-hop details of the virtual network path
  - **Not reachable** – it identifies the blocking component(s) (e.g., configuration issues in SGs, NACLs, Route Tables, …)

- Use cases: troubleshoot connectivity issues, ensure network configuration is as intended, …
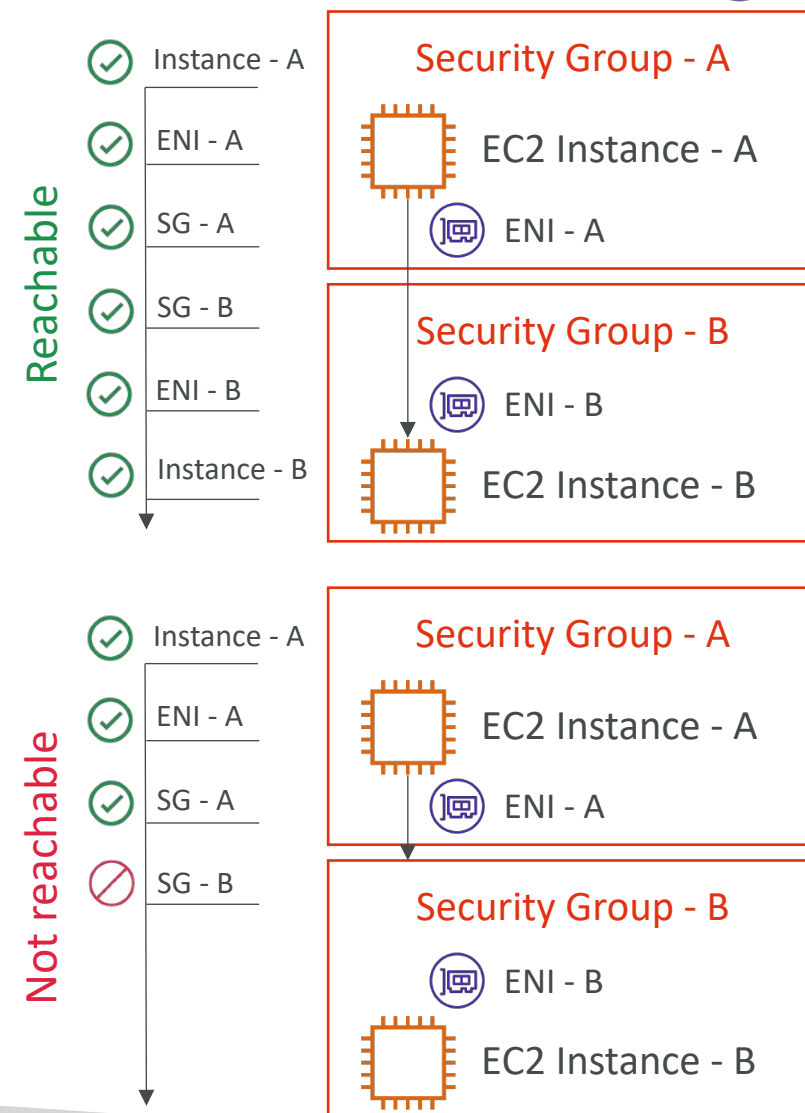

VPC Peering

- Privately connect two VPCs using AWS' network

- Make them behave as if they were in the same network

- Must not have overlapping CIDRs

- VPC Peering connection is **NOT transitive** (must be established for each VPC that need to communicate with one another)

- You must update route tables in each VPC's subnets to ensure EC2 instances can communicate with each other

VPC - A

VPC Peering
(A – B)

VPC Peering
(A – C)

VPC - B
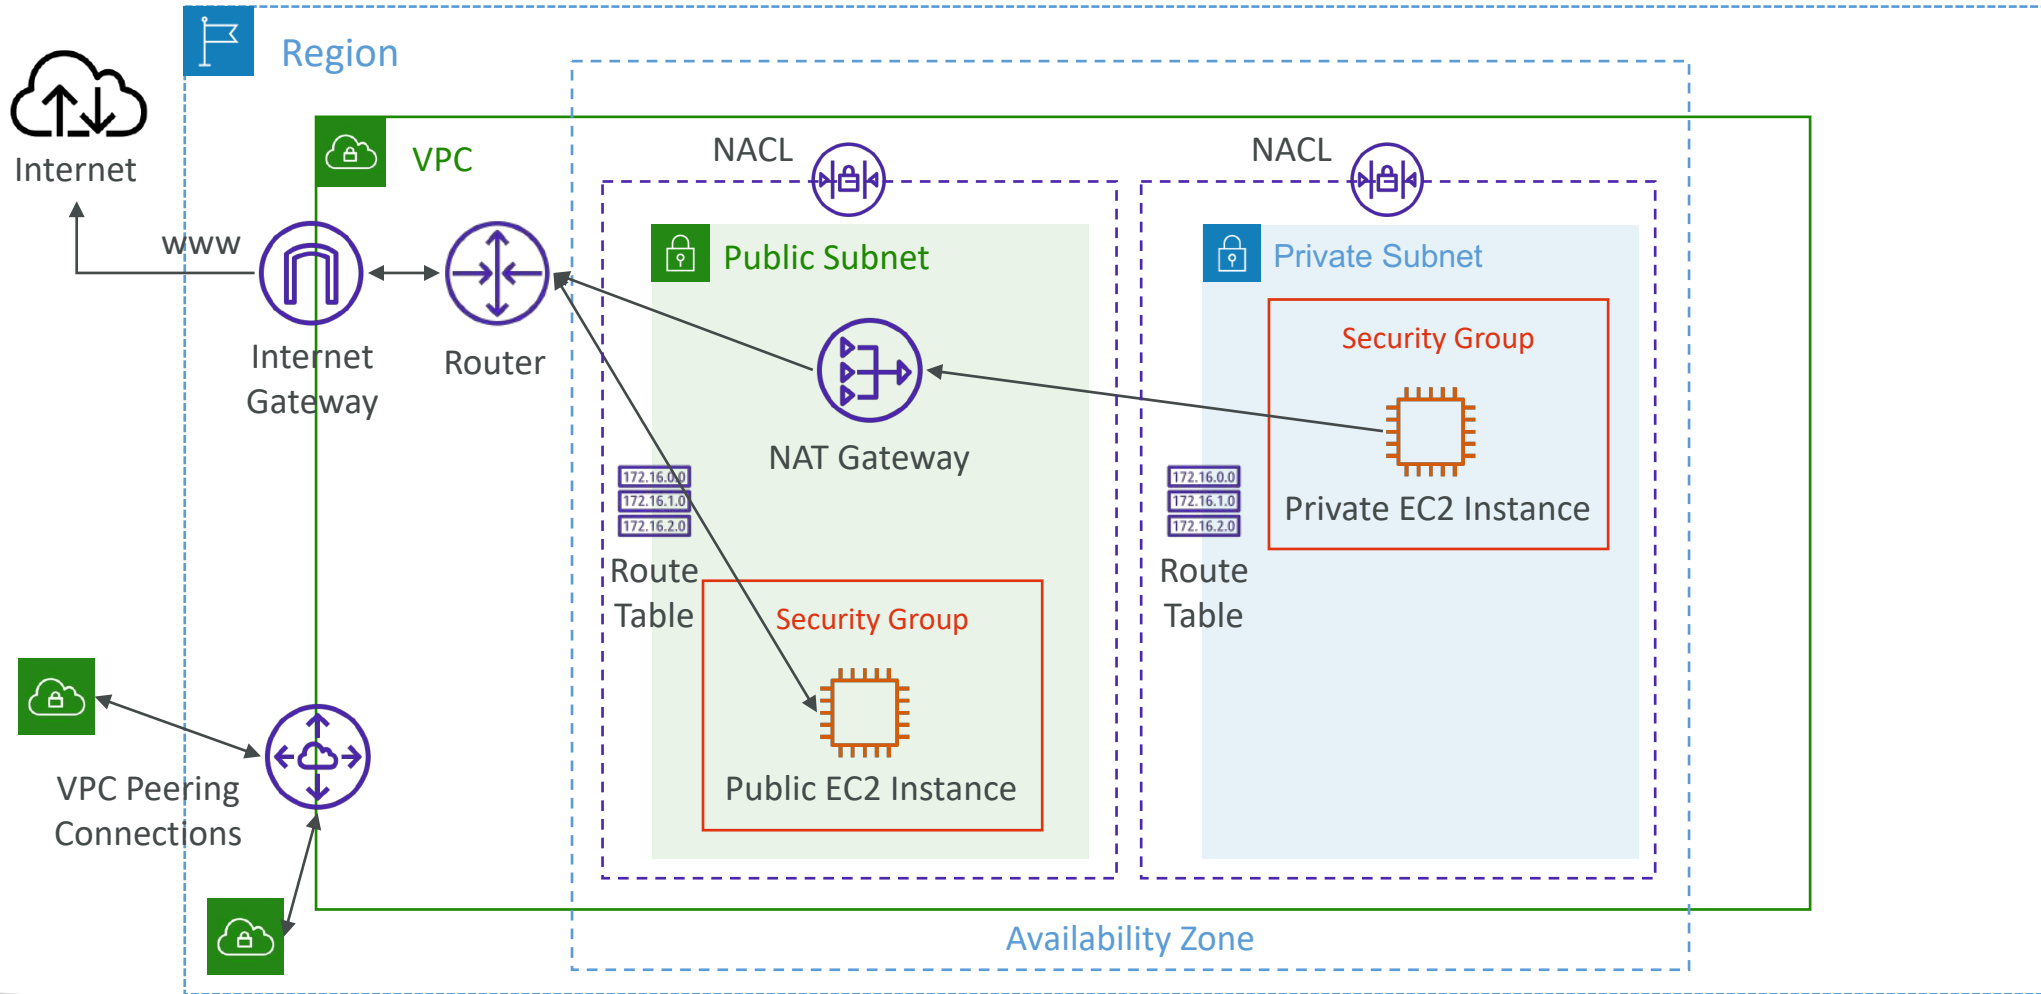

VPC Peering
(B – C)

VPC - C
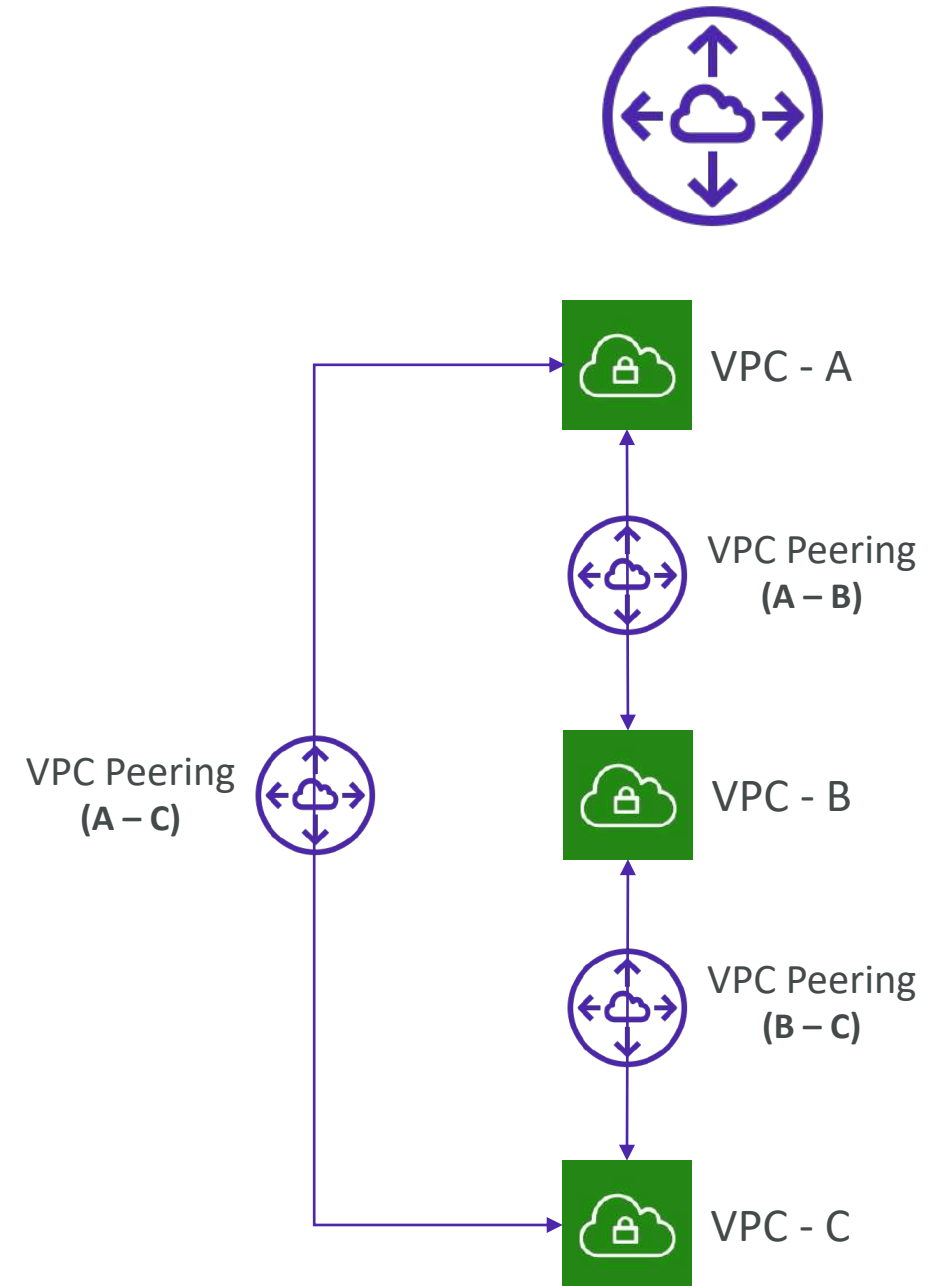

VPC Peering – Good to know

- You can create VPC Peering connection between VPCs in **different AWS accounts/regions**

- You can reference a security group in a peered VPC (works cross accounts – same region)
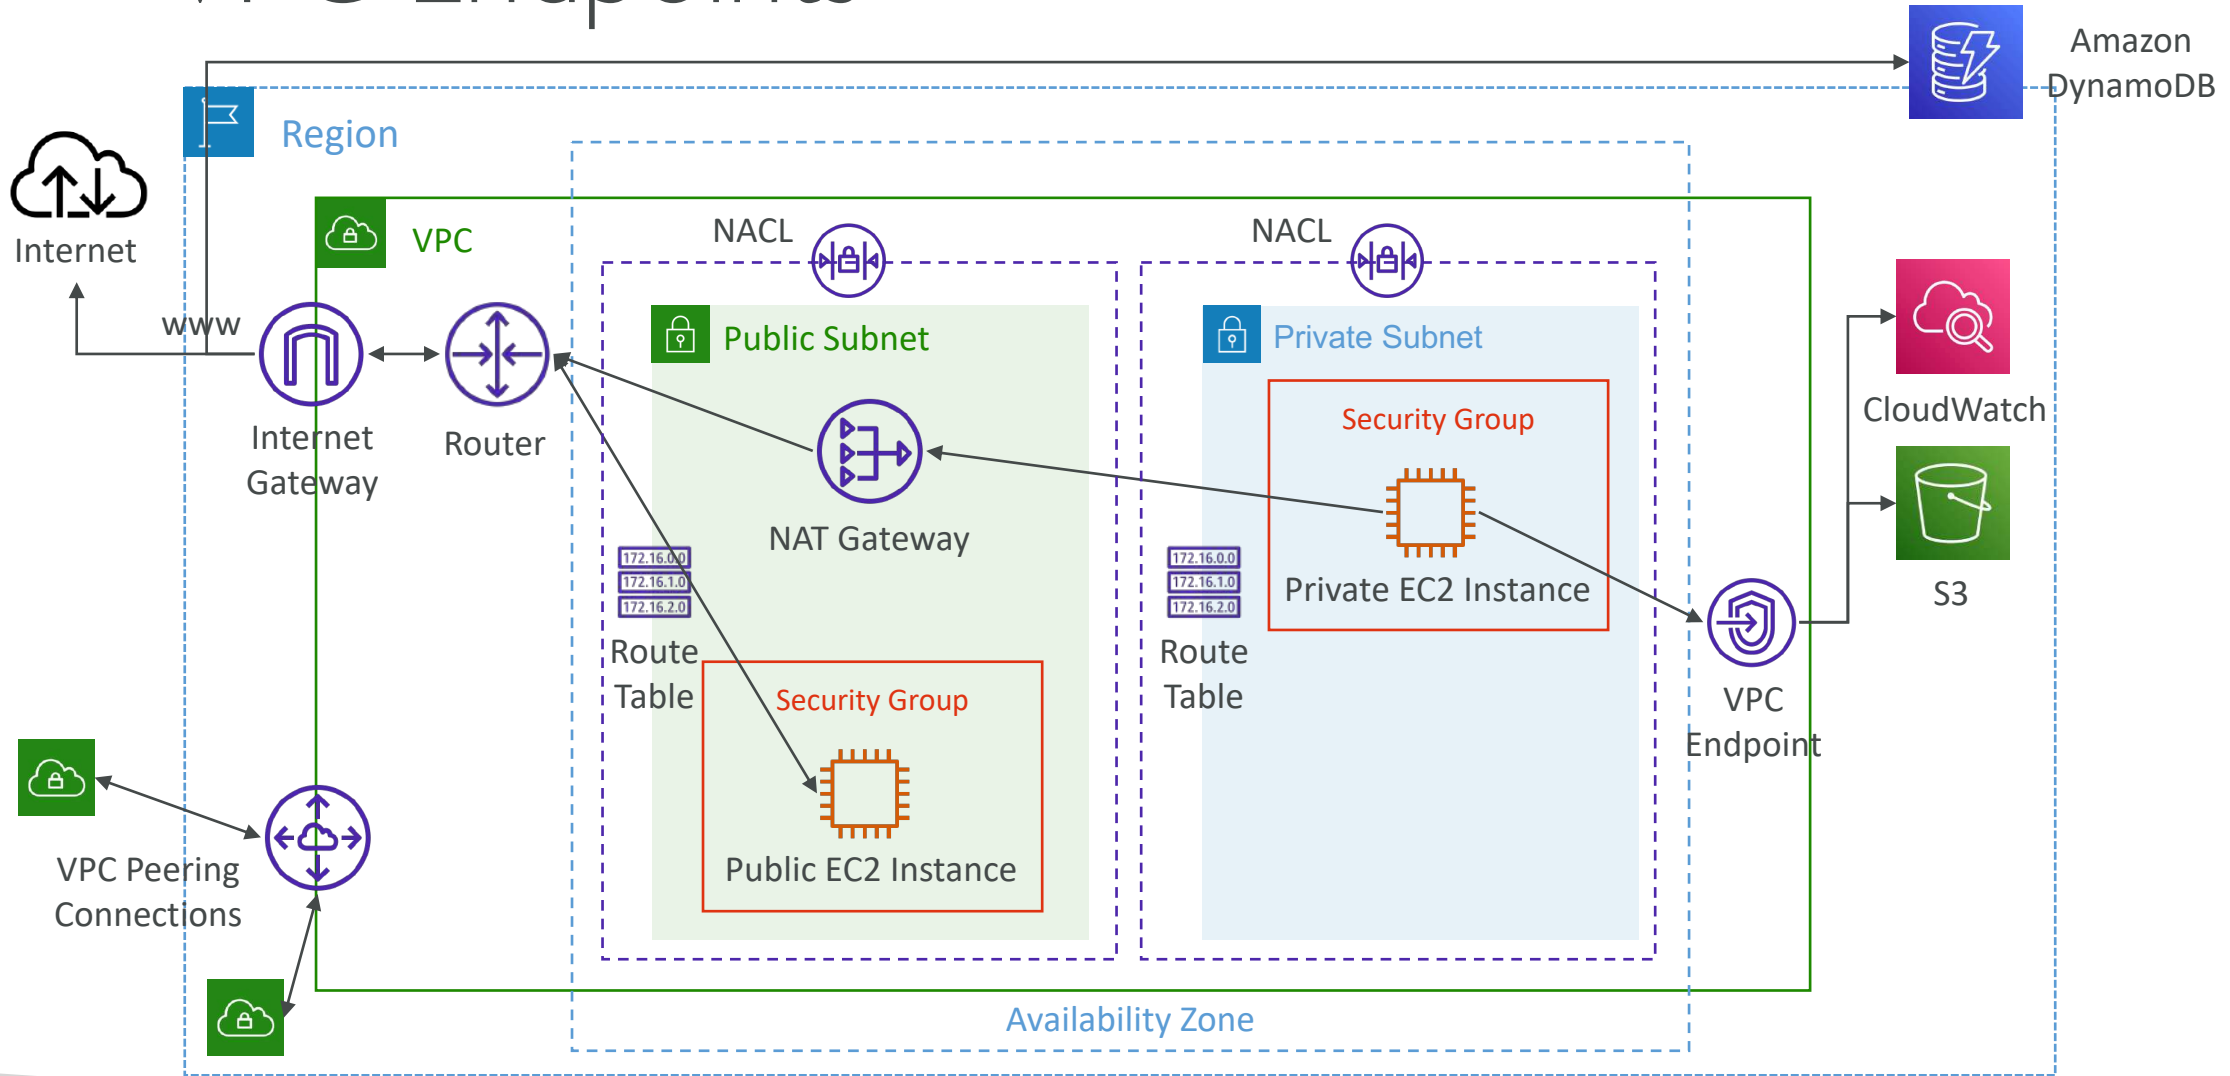

| Type	Protocol	Port range	Source
HTTP	TCP	80	sg-04991f9af3473b939 / default
HTTP	TCP	80	██████████ / sg-027ad1f7865d4be76

Account ID

VPC Peering

VPC Endpoints

VPC Endpoints (AWS PrivateLink)

- Every AWS service is publicly exposed (public URL)

- VPC Endpoints (powered by AWS PrivateLink) allows you to connect to AWS services using a **private network** instead of using the public Internet

- They're redundant and scale horizontally

- They remove the need of IGW, NATGW, … to access AWS Services

- In case of issues:
  - Check DNS Setting Resolution in your VPC
  - Check Route Tables

Amazon SNS

www

Region

Internet Gateway

Public Subnet

EC2 Instance

NAT Gateway

Private Subnet

Option 1

EC2 Instance

Option 2

VPC Endpoint

Amazon SNS

Types of Endpoints

- Interface Endpoints (powered by PrivateLink)
  - Provisions an ENI (private IP address) as an entry point (must attach a Security Group)
  - Supports most AWS services
  - $ per hour + $ per GB of data processed

- Gateway Endpoints
  - Provisions a gateway and must be used as a target in a route table (does not use security groups)
  - Supports both S3 and DynamoDB
  - Free
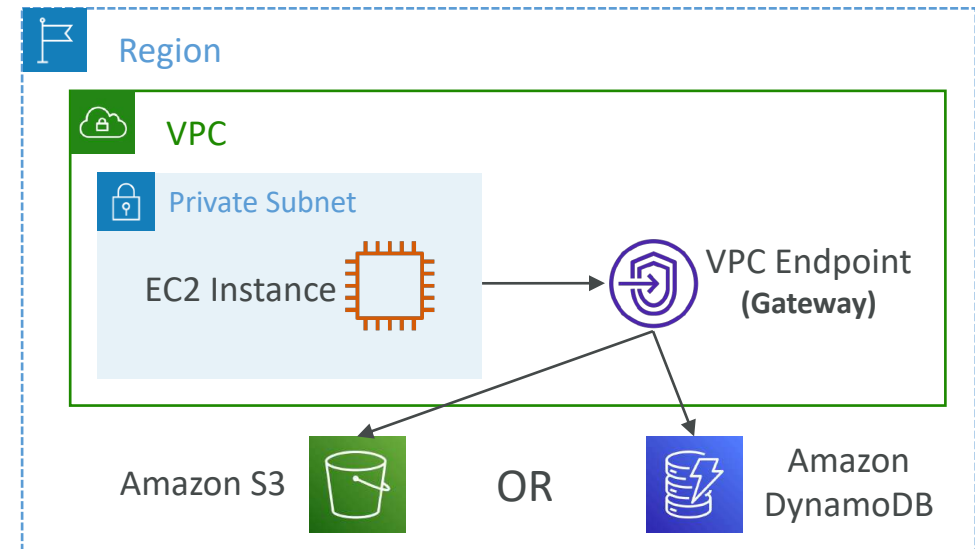

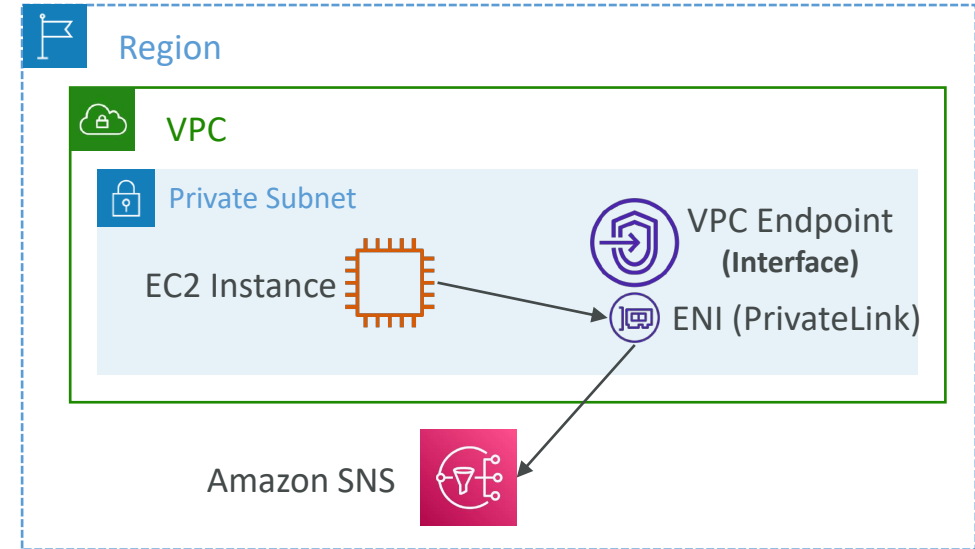

Gateway or Interface Endpoint for S3?

- Gateway is most likely going to be preferred all the time at the exam

- Cost: free for Gateway, $ for interface endpoint

- Interface Endpoint is preferred access is required from on-premises (Site to Site VPN or Direct Connect), a different VPC or a different region
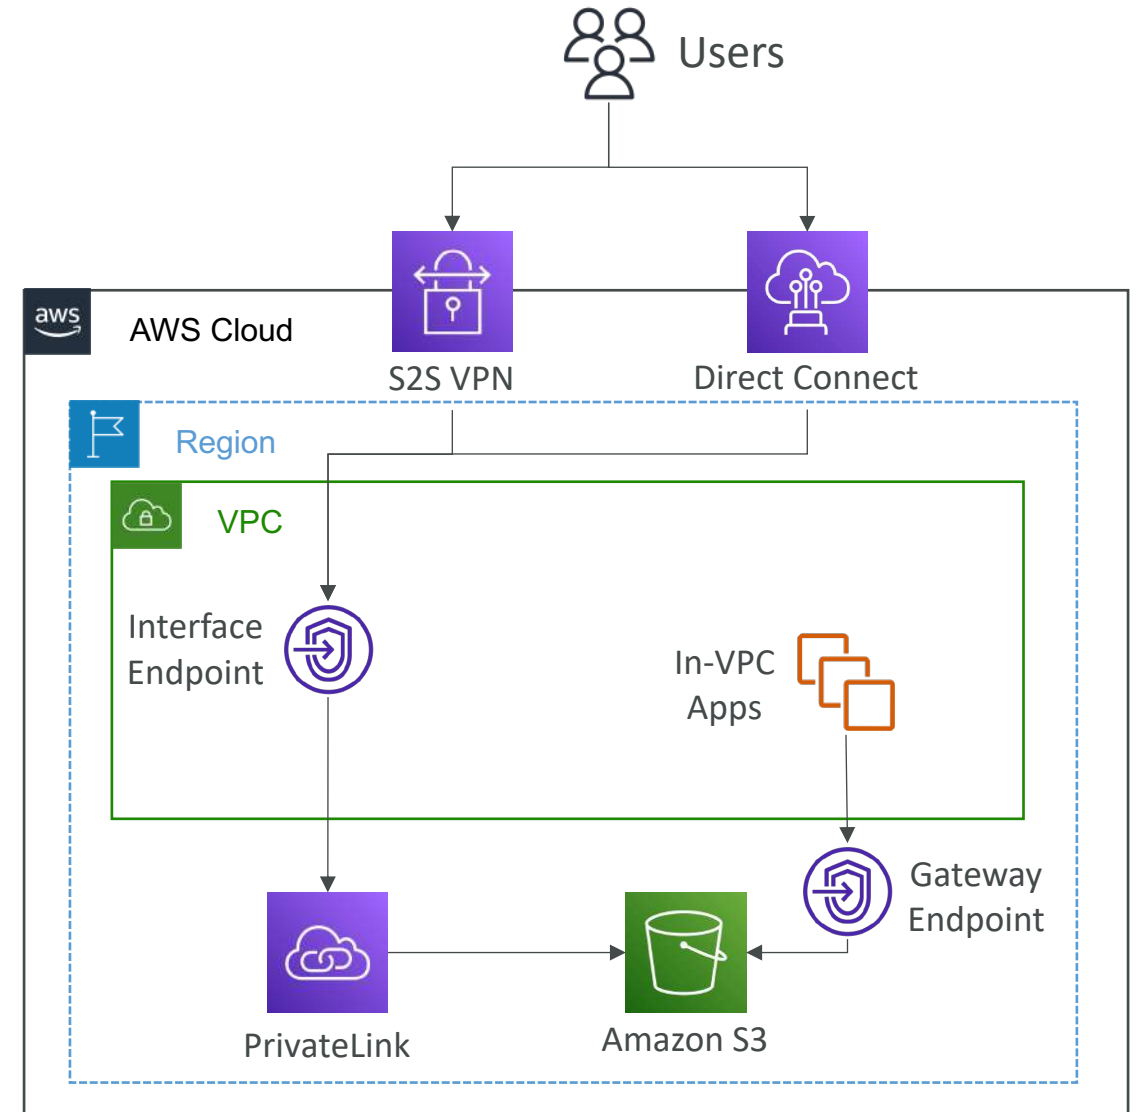

Lambda in VPC accessing DynamoDB

- DynamoDB is a public service from AWS

- Option 1: Access from the public internet
  - Because Lambda is in a VPC, it needs a NAT Gateway in a public subnet and an internet gateway

- Option 2 (better & free): Access from the private VPC network
  - Deploy a VPC Gateway endpoint for DynamoDB
  - Change the Route Tables
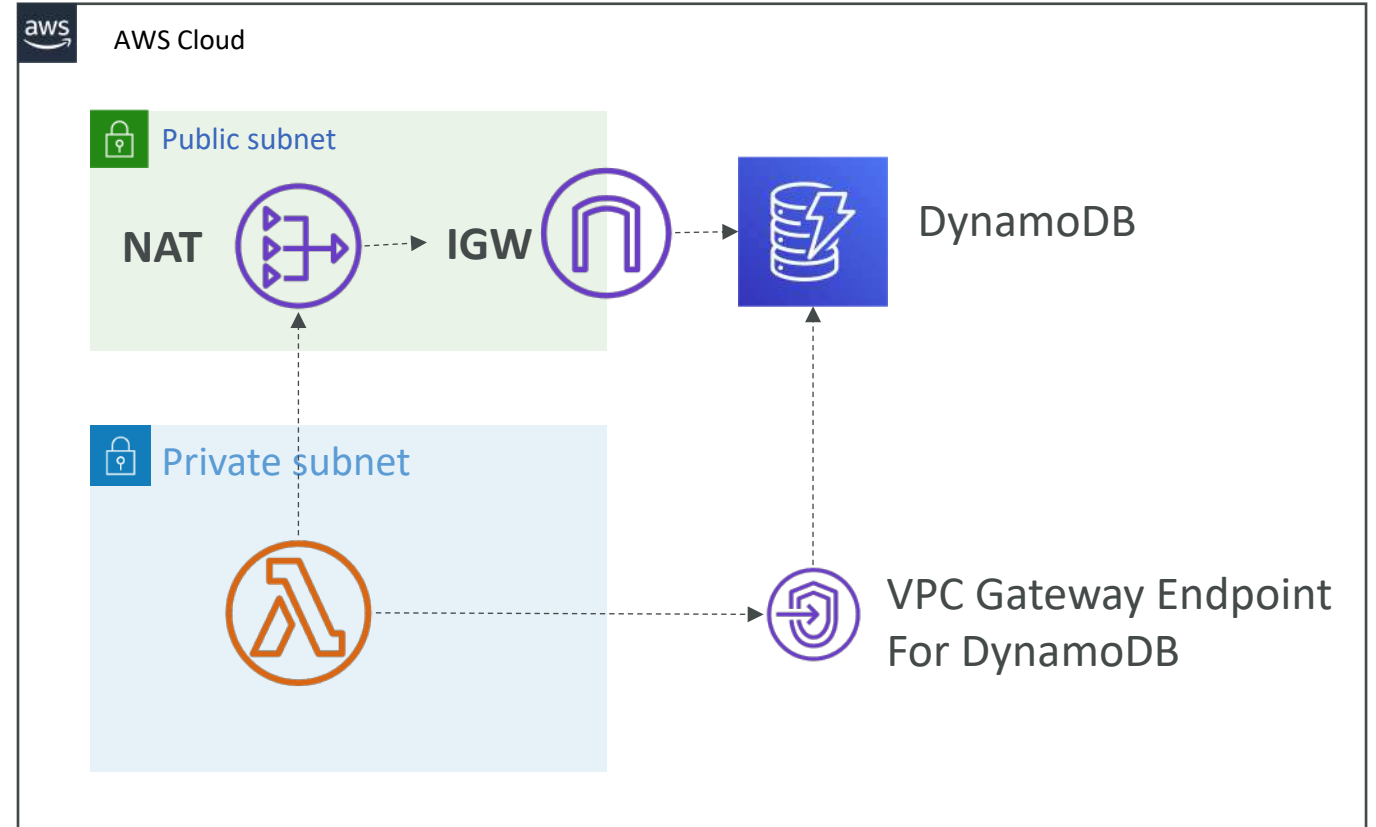

VPC Flow Logs

- Capture information about IP traffic going into your interfaces:
  - VPC Flow Logs
  - Subnet Flow Logs
  - Elastic Network Interface (ENI) Flow Logs

- Helps to monitor & troubleshoot connectivity issues

- Flow logs data can go to S3, CloudWatch Logs, and Kinesis Data Firehose

- Captures network information from AWS managed interfaces too: ELB, RDS, ElastiCache, Redshift, WorkSpaces, NATGW, Transit Gateway…

VPC Flow Logs
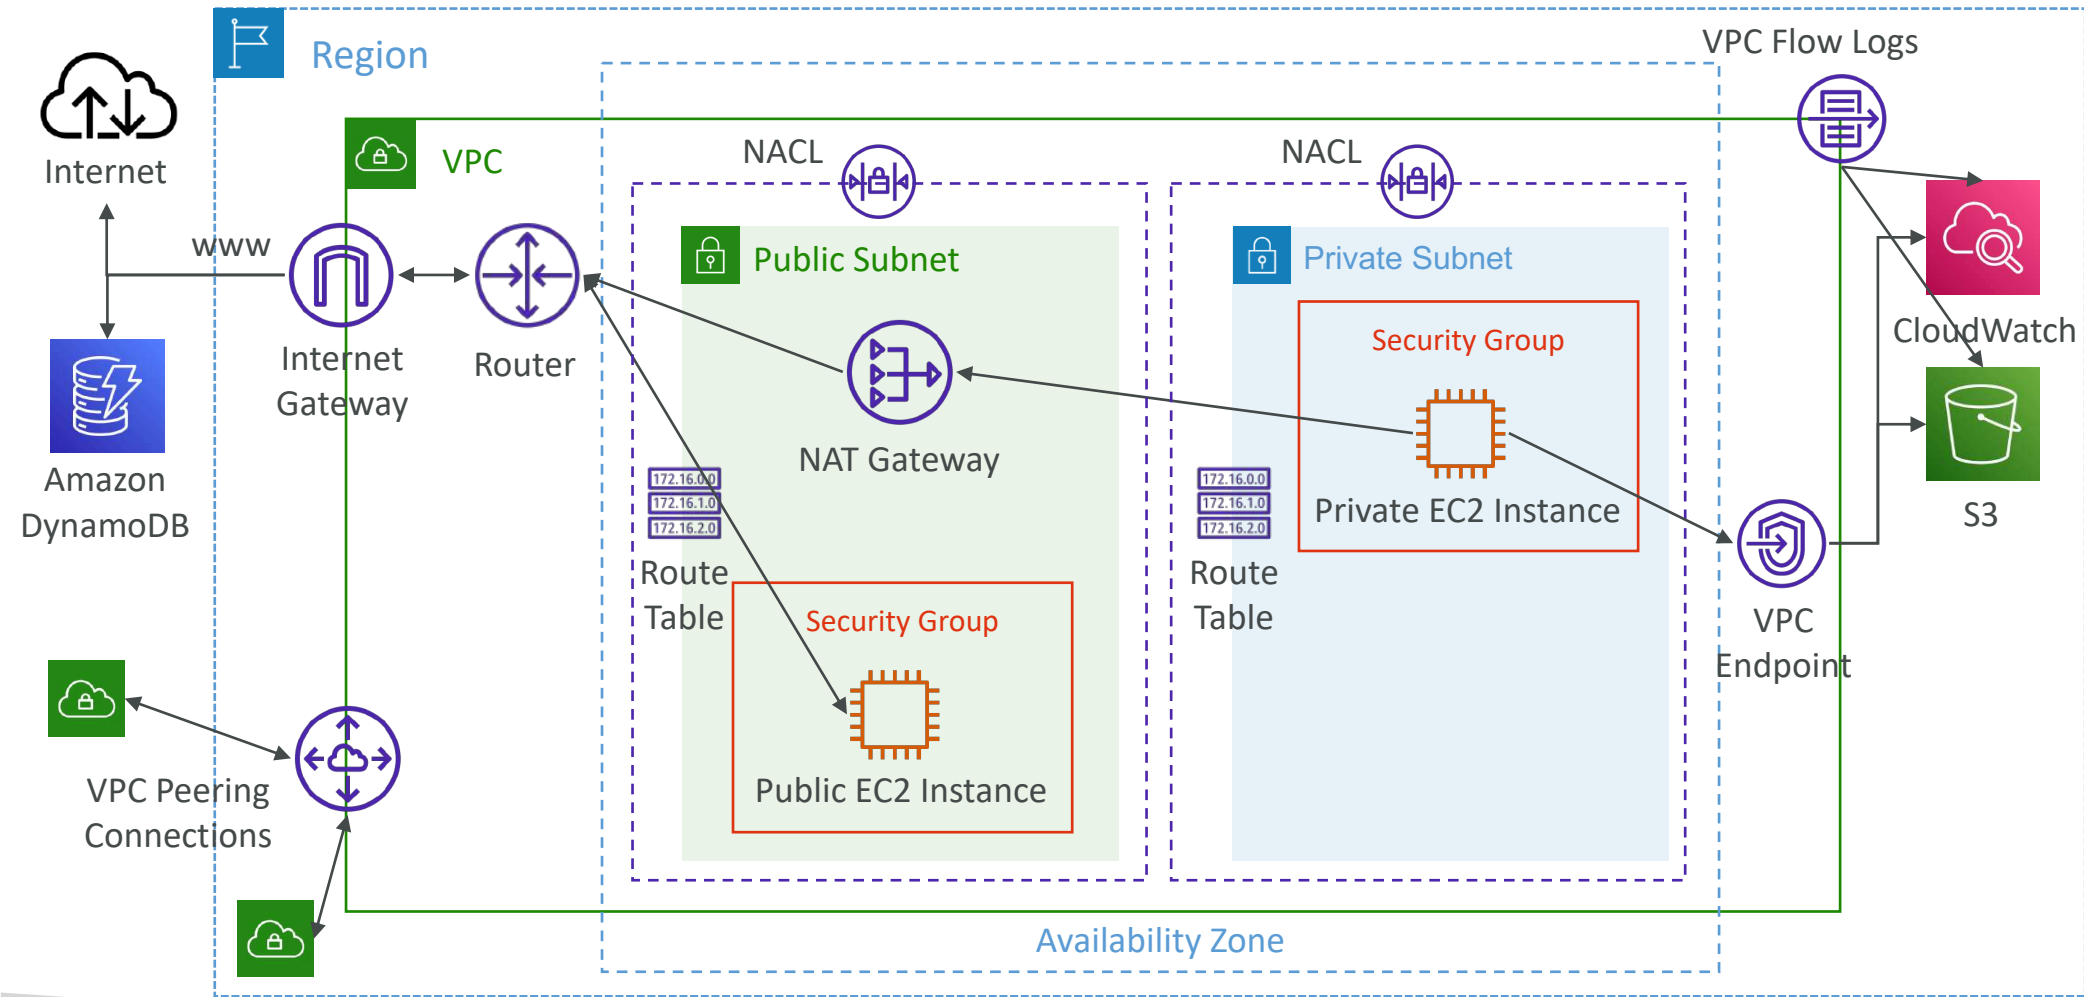

VPC Flow Logs Syntax

version		interface-id		dstaddr		dstport	packets		start		action

```
2 123456789010 eni-1235b8ca123456789 172.31.16.139 172.31.16.21 20641 22 6 20 4249 1418530010 1418530070 ACCEPT OK
2 123456789010 eni-1235b8ca123456789 172.31.9.69 172.31.9.12 49761 3389 6 20 4249 1418530010 1418530070 REJECT OK
```

	account-id		srcaddr		srcport	protocol	bytes		end		log-status

- srcaddr & dstaddr – help identify problematic IP
- srcport & dstport – help identity problematic ports
- Action – success or failure of the request due to Security Group / NACL
- Can be used for analytics on usage patterns, or malicious behavior
- Query VPC flow logs using Athena on S3 or CloudWatch Logs Insights
- Flow Logs examples: https://docs.aws.amazon.com/vpc/latest/userguide/flow-logs-records-examples.html

VPC Flow Logs – Troubleshoot SG & NACL issues

Look at the **"ACTION"** field

Incoming Requests

- Inbound REJECT => NACL or SG
- Inbound ACCEPT, Outbound REJECT => NACL
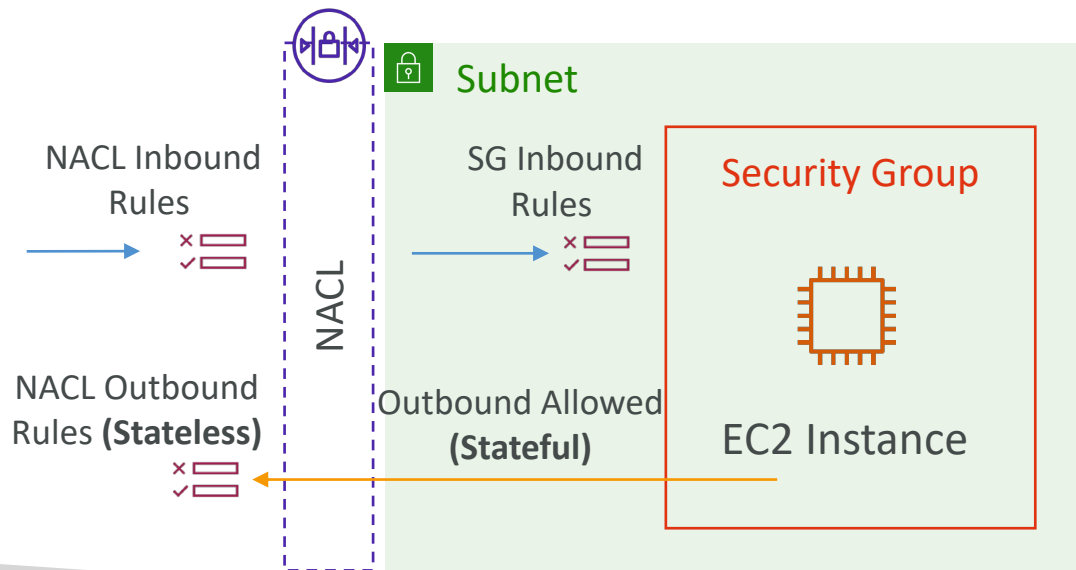

Outgoing Requests

- Outbound REJECT => NACL or SG
- Outbound ACCEPT, Inbound REJECT => NACL
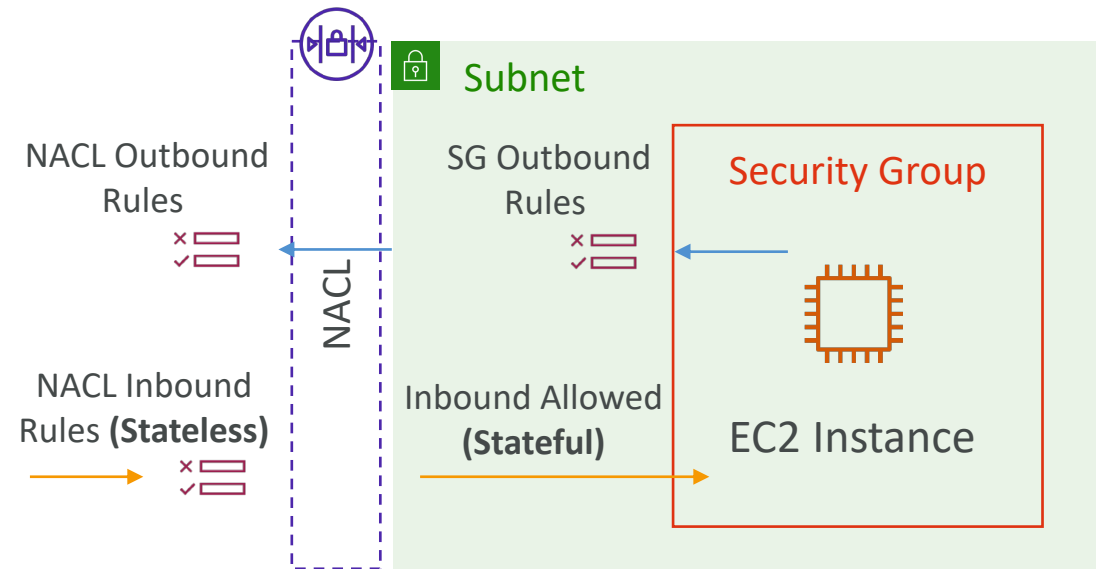

VPC Flow Logs – Architectures
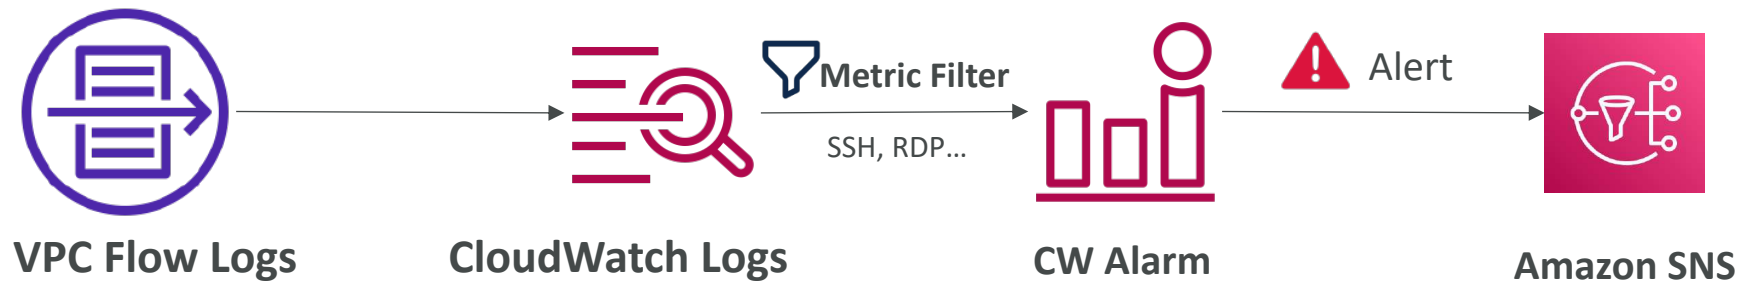

AWS Site-to-Site VPN
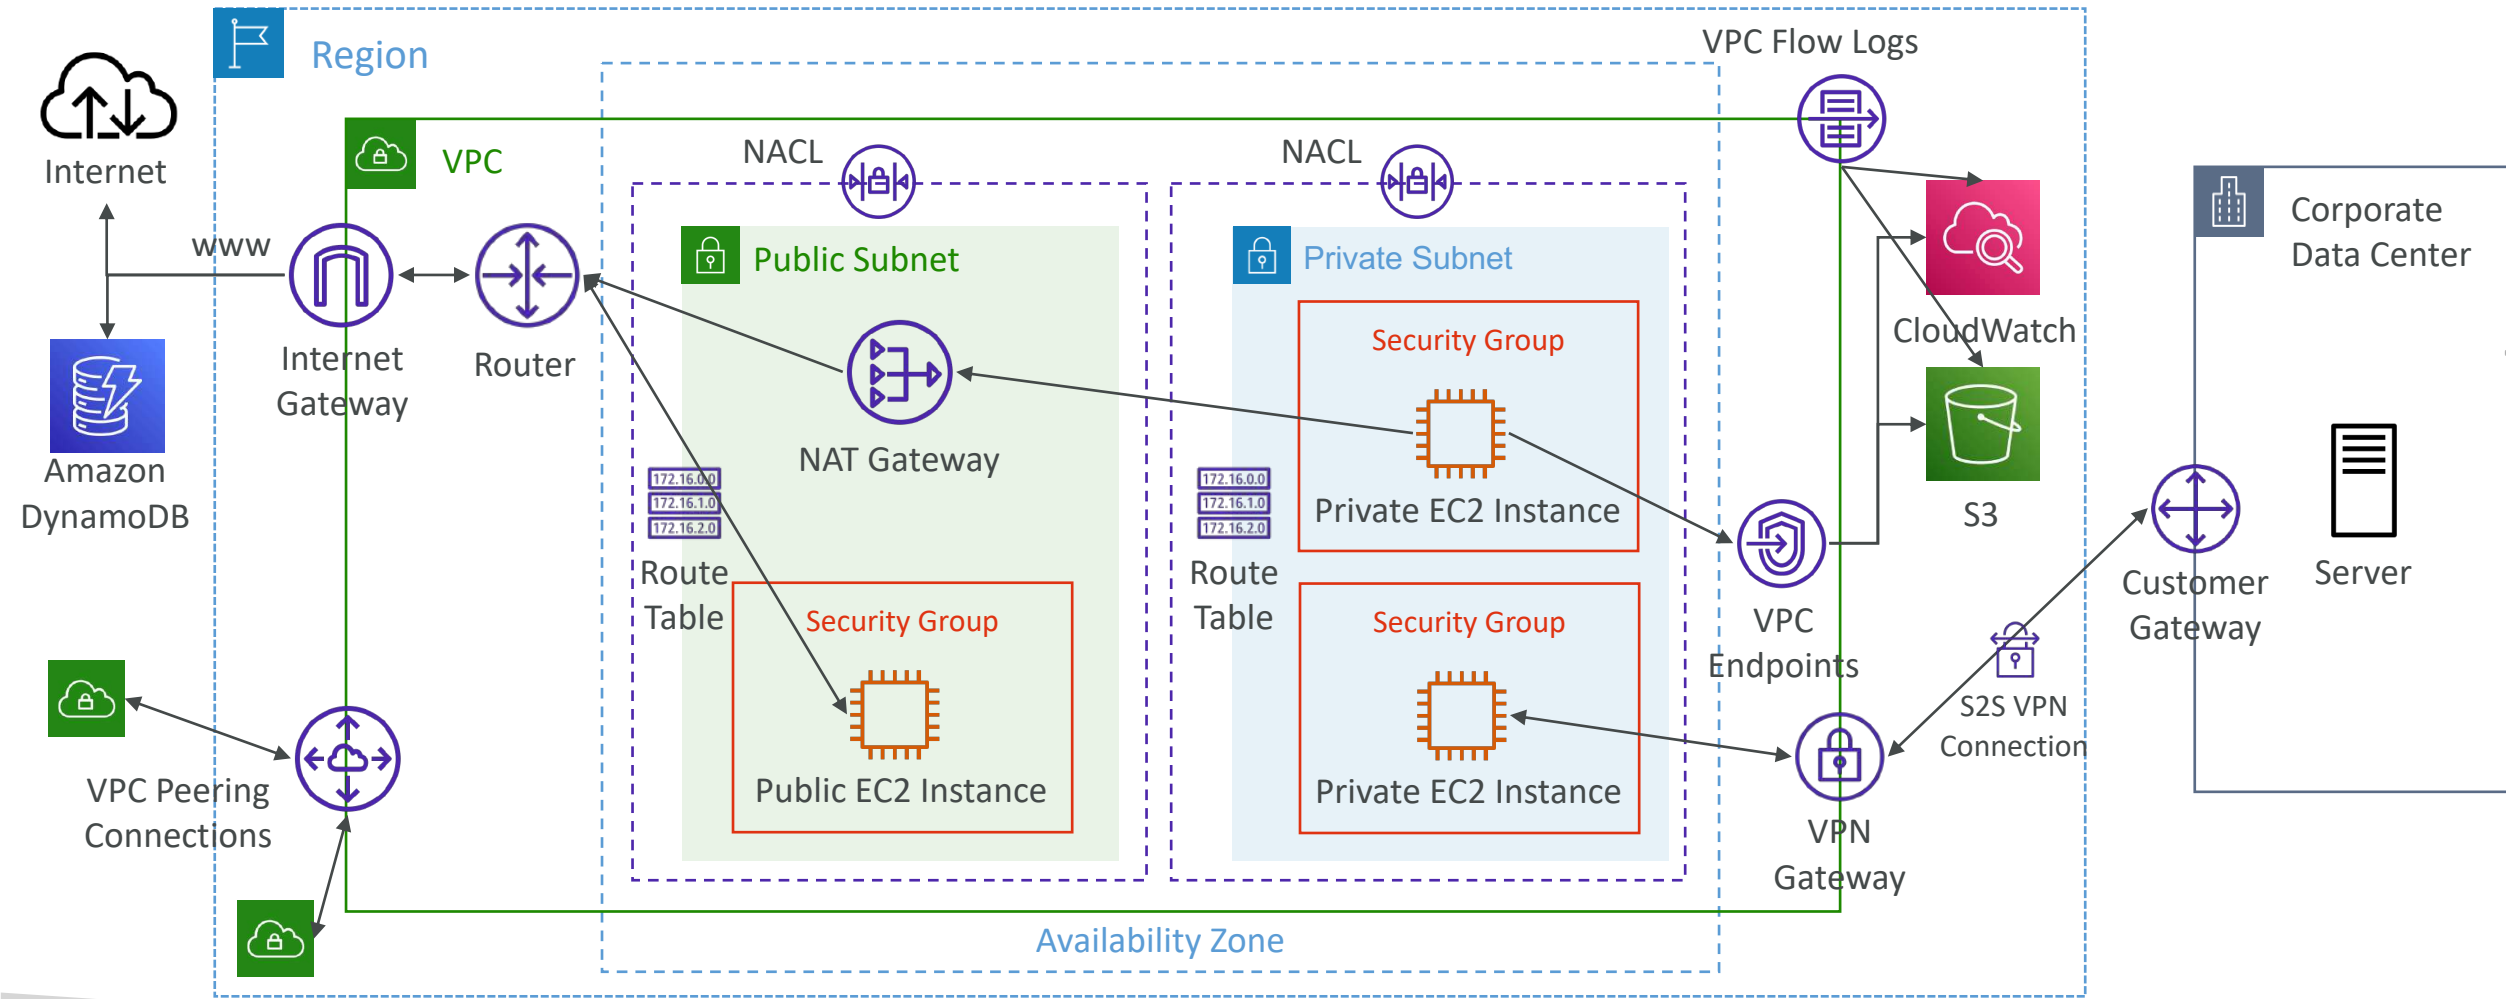

AWS Site-to-Site VPN

- Virtual Private Gateway (VGW)
  - VPN concentrator on the AWS side of the VPN connection
  - VGW is created and attached to the VPC from which you want to create the Site-to-Site VPN connection
  - Possibility to customize the ASN (Autonomous System Number)

- Customer Gateway (CGW)
  - Software application or physical device on customer side of the VPN connection
  - https://docs.aws.amazon.com/vpn/latest/s2svpn/your-cgw.html#DevicesTested

Site-to-Site VPN Connections

- Customer Gateway Device (On-premises)
  - What IP address to use?
    - Public Internet-routable IP address for your Customer Gateway device
    - If it's behind a NAT device that's enabled for NAT traversal (NAT-T), use the public IP address of the NAT device

- <u>Important step:</u> enable **Route Propagation** for the Virtual Private Gateway in the route table that is associated with your subnets

- If you need to ping your EC2 instances from on-premises, make sure you add the ICMP protocol on the inbound of your security groups
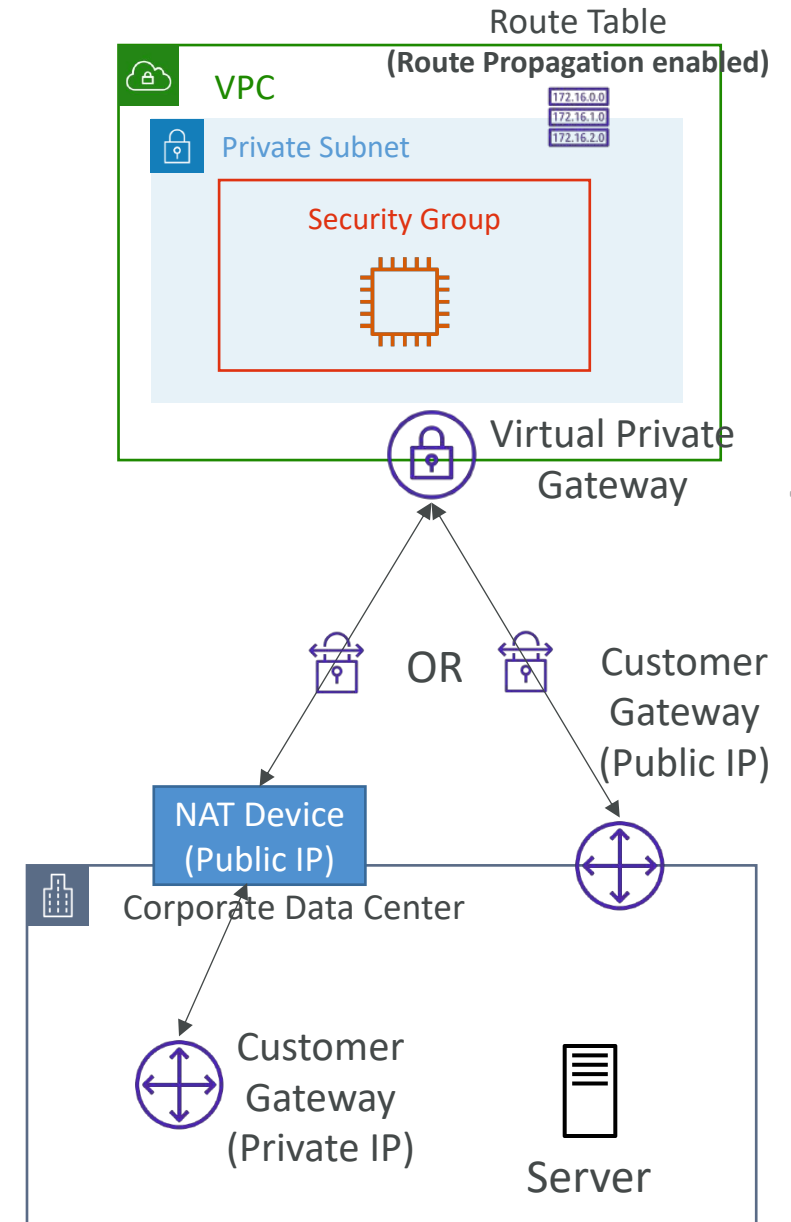

AWS VPN CloudHub

- Provide secure communication between multiple sites, if you have multiple VPN connections

- Low-cost hub-and-spoke model for primary or secondary network connectivity between different locations (VPN only)

- It's a VPN connection so it goes over the public Internet

- To set it up, connect multiple VPN connections on the same VGW, setup dynamic routing and configure route tables
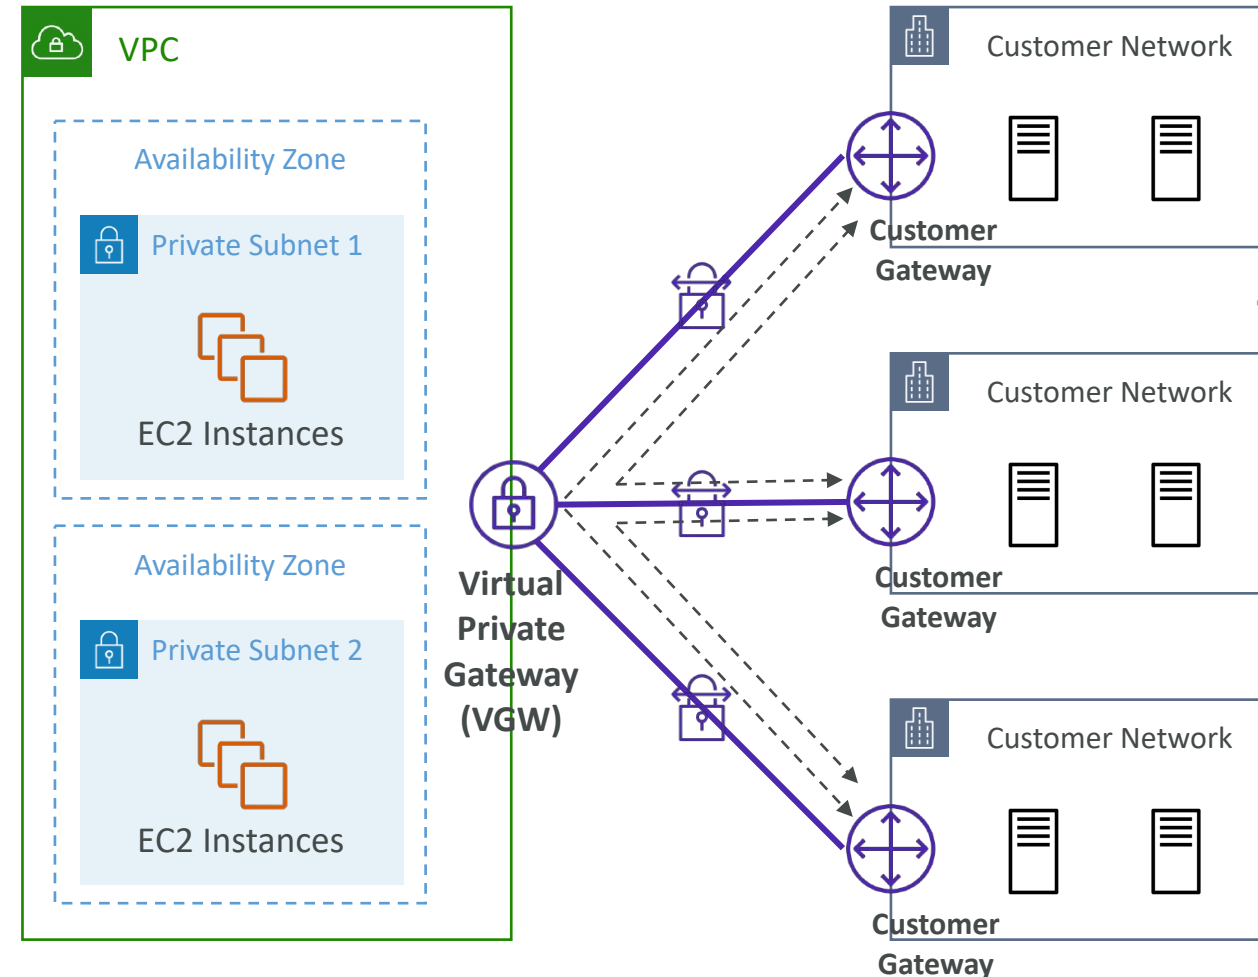

Direct Connect (DX)

- Provides a dedicated **private** connection from a remote network to your VPC

- Dedicated connection must be setup between your DC and AWS Direct Connect locations

- You need to setup a Virtual Private Gateway on your VPC

- Access public resources (S3) and private (EC2) on same connection

- Use Cases:
  - Increase bandwidth throughput - working with large data sets – lower cost
  - More consistent network experience - applications using real-time data feeds
  - Hybrid Environments (on prem + cloud)

- Supports both IPv4 and IPv6

Direct Connect Diagram

www.datacumulus.com

© Stephane Maarek
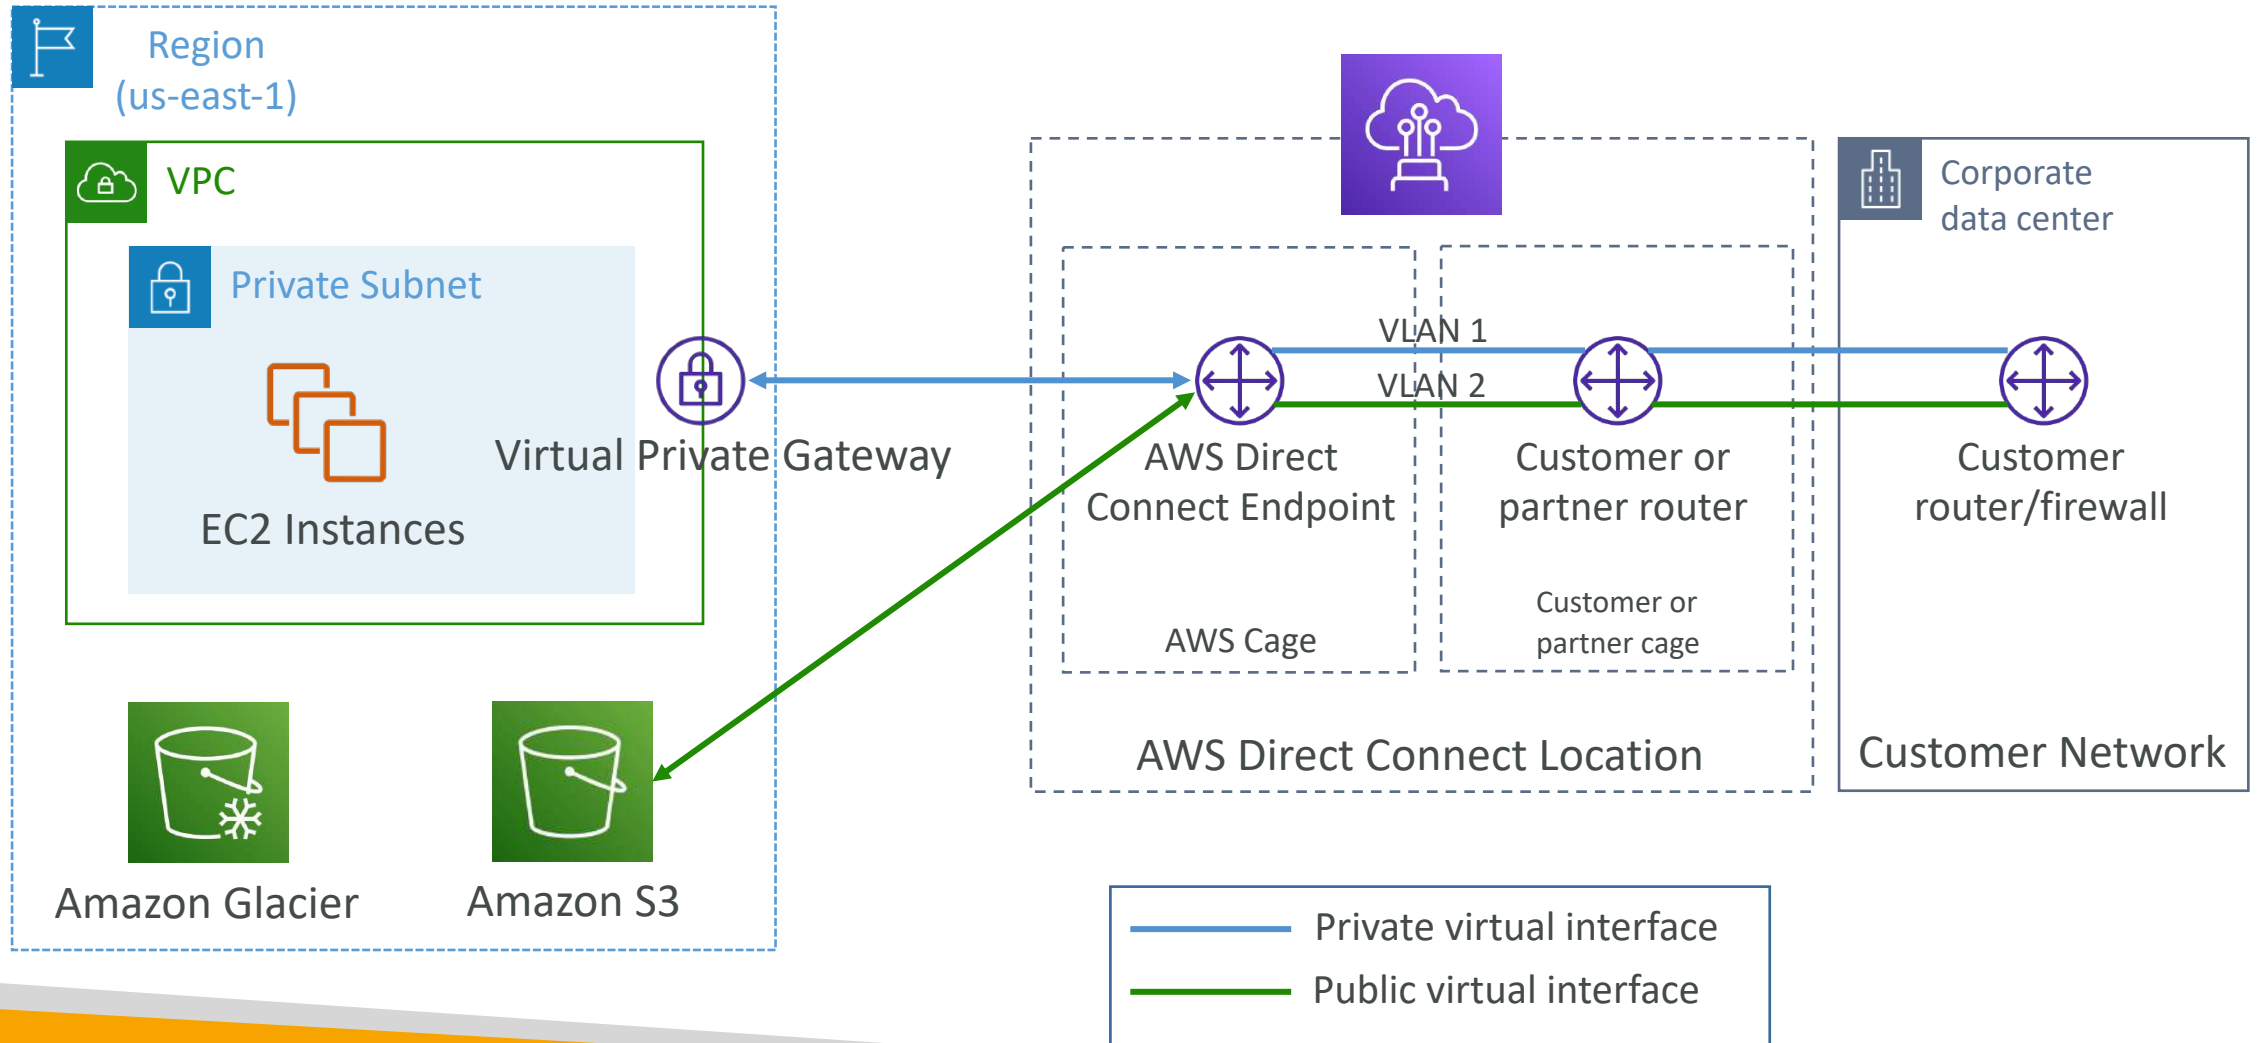

Direct Connect Gateway

- If you want to setup a Direct Connect to one or more VPC in many different regions (same account), you must use a Direct Connect Gateway
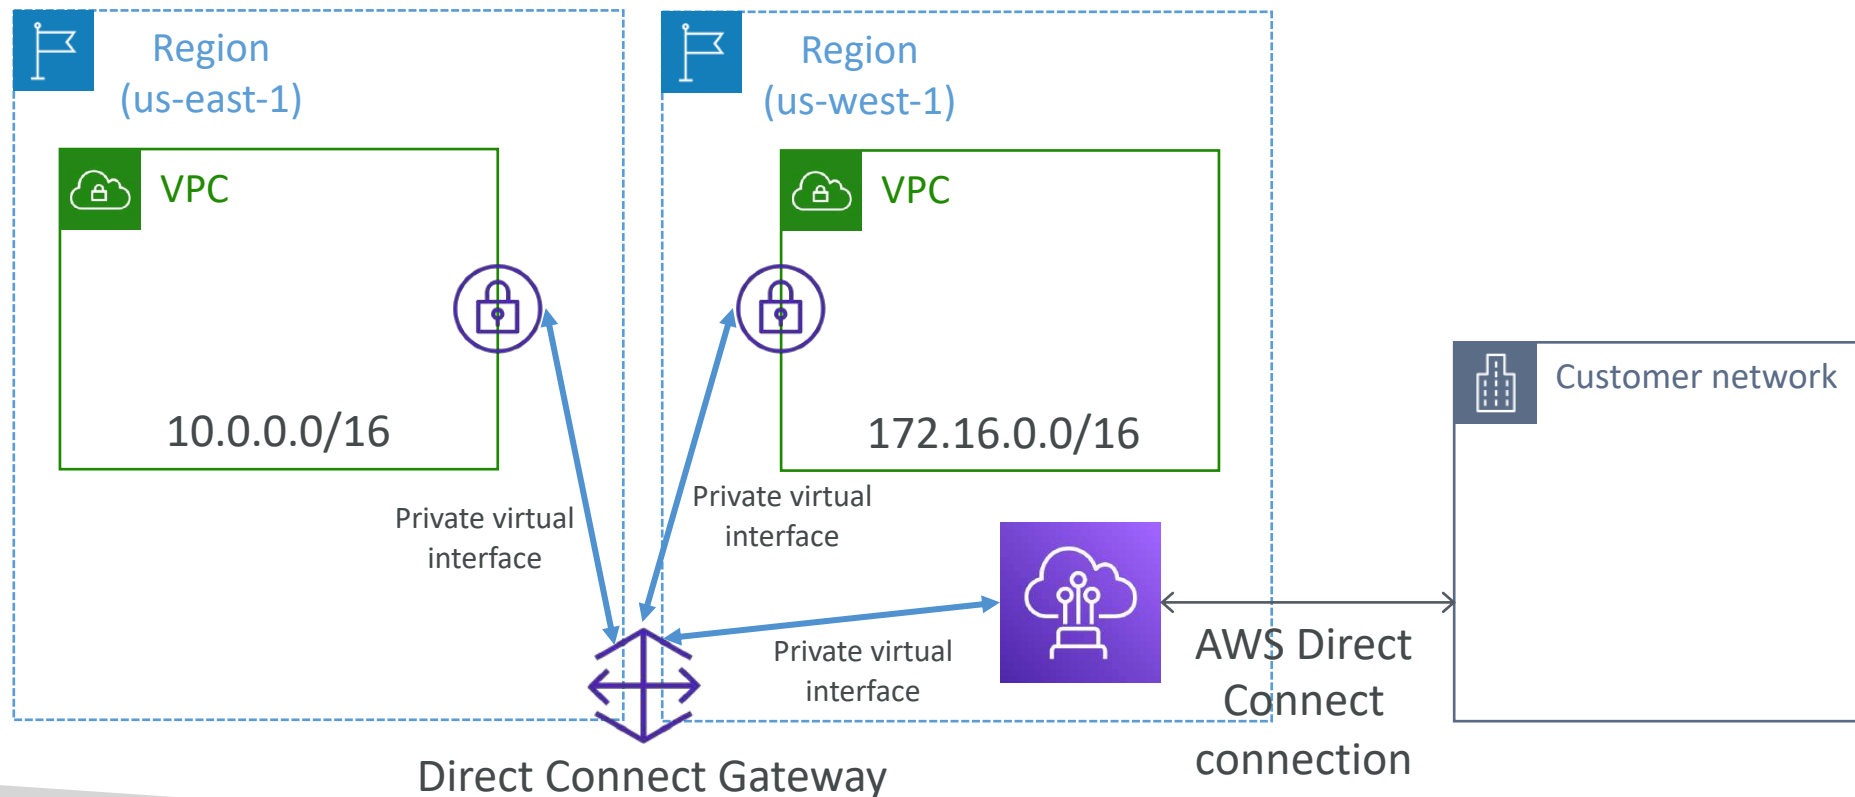

Direct Connect – Connection Types

- **Dedicated Connections:** 1Gbps,10 Gbps and 100 Gbps capacity
  - Physical ethernet port dedicated to a customer
  - Request made to AWS first, then completed by AWS Direct Connect Partners

- **Hosted Connections:** 50Mbps, 500 Mbps, to 10 Gbps
  - Connection requests are made via AWS Direct Connect Partners
  - Capacity can be **added or removed on demand**
  - 1, 2, 5, 10 Gbps available at select AWS Direct Connect Partners

- Lead times are often longer than 1 month to establish a new connection

Direct Connect – Encryption

- Data in transit is <u>not encrypted</u> but is private

- AWS Direct Connect + VPN provides an IPsec-encrypted private connection

- Good for an extra level of security, but slightly more complex to put in place
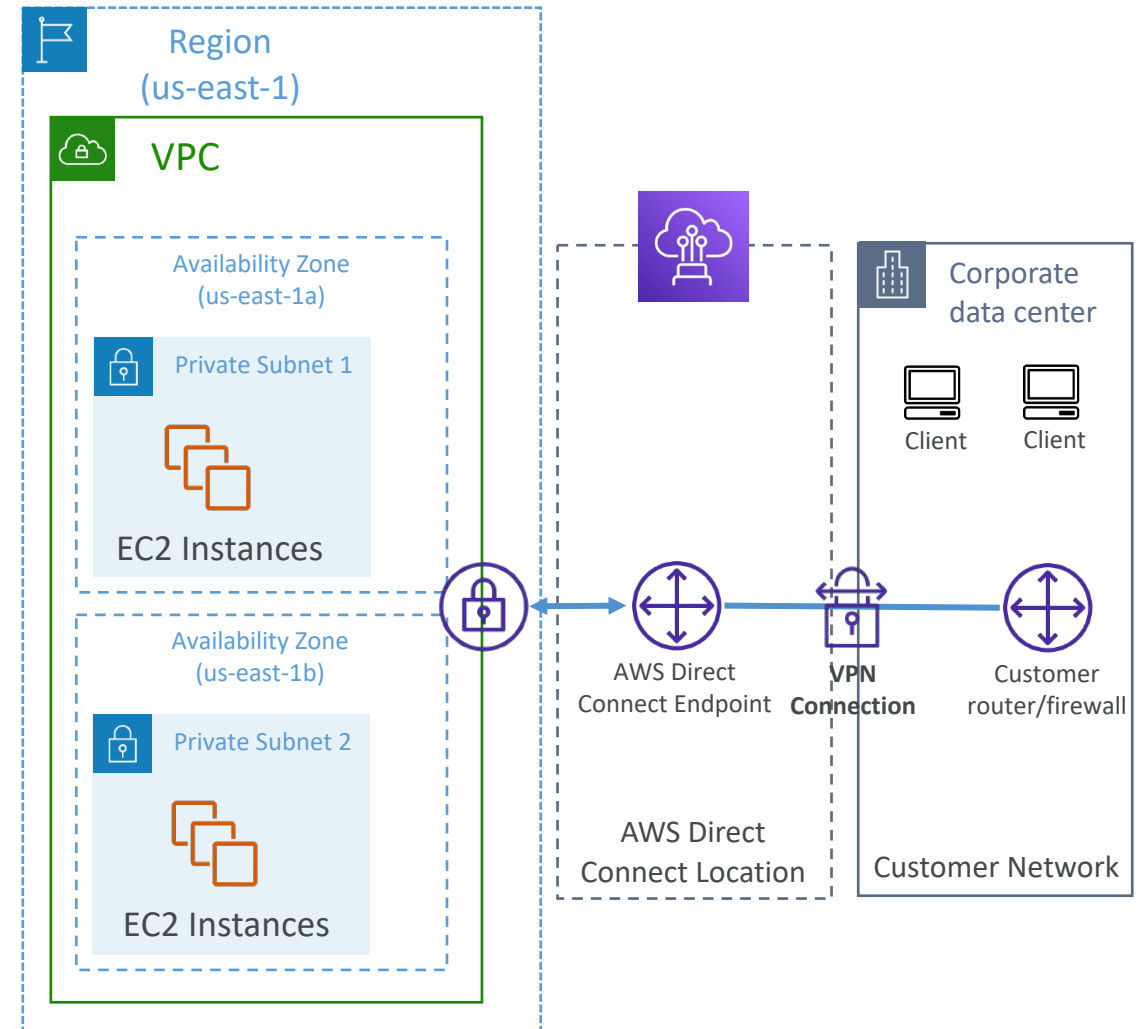

Direct Connect - Resiliency

High Resiliency for Critical Workloads

Region

AWS Direct Connect Location - 1

Corporate data center

AWS Direct Connect Location - 2

Corporate data center
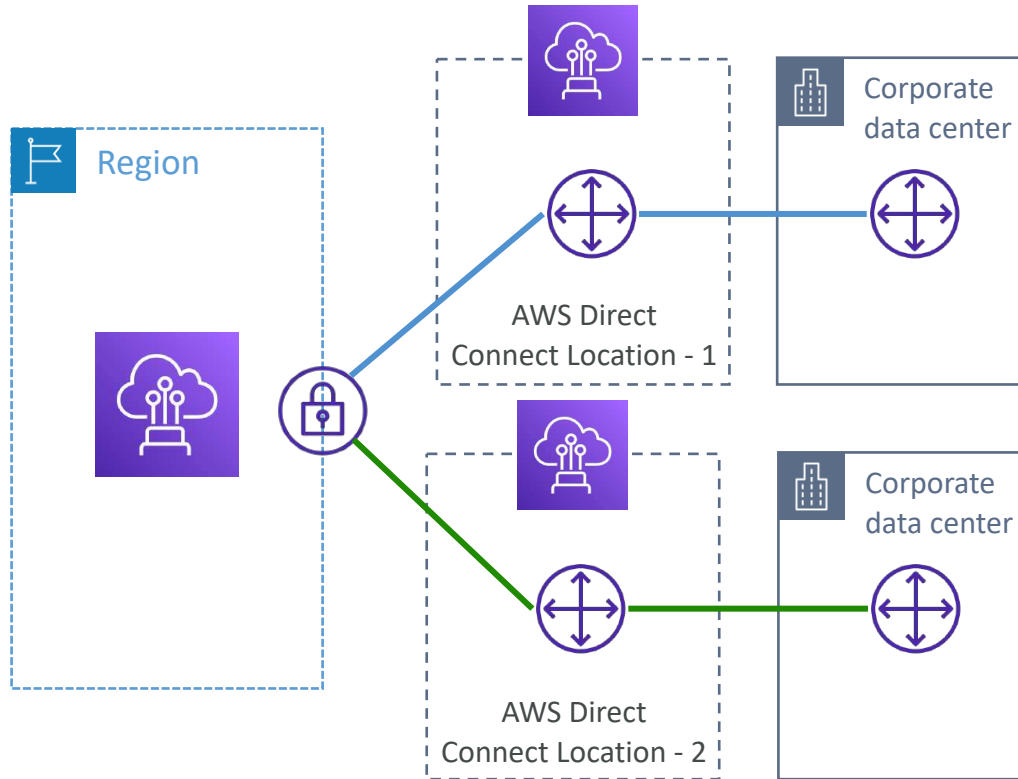

One connection at multiple locations

Maximum Resiliency for Critical Workloads

Region

AWS Direct Connect Location - 1

Corporate data center

AWS Direct Connect Location - 2

Corporate data center
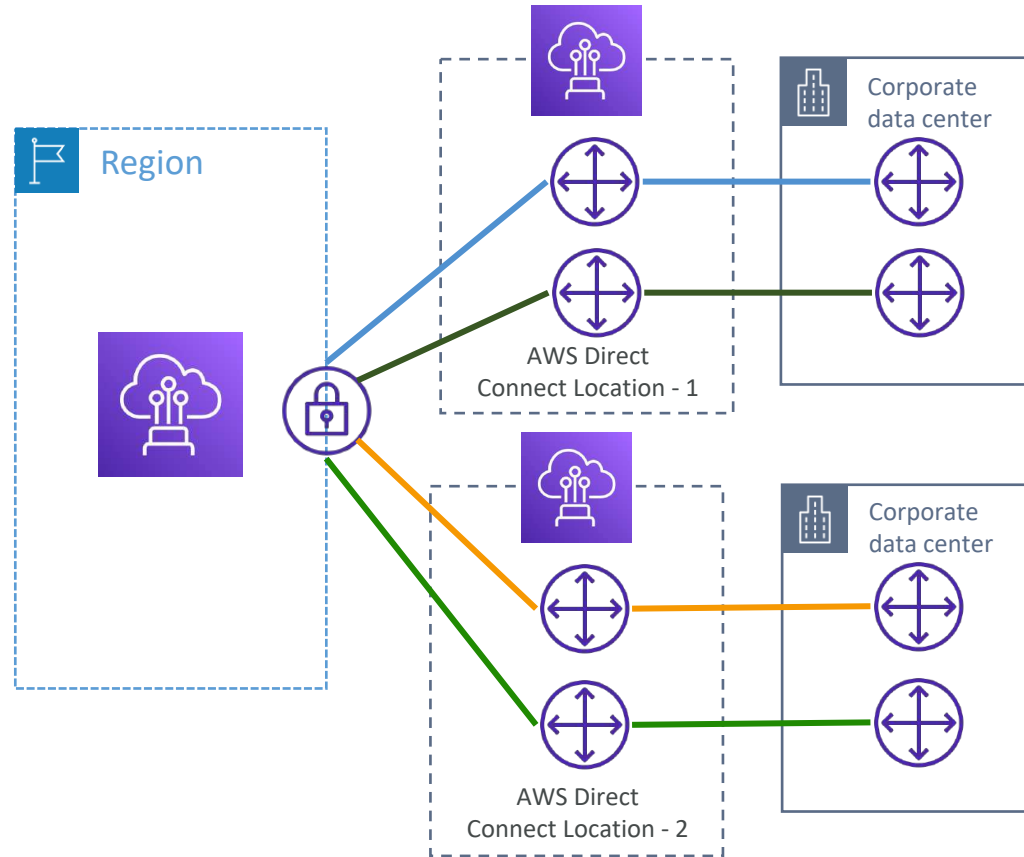

Maximum resilience is achieved by separate connections terminating on separate devices in more than one location.

Site-to-Site VPN connection as a backup

- In case Direct Connect fails, you can set up a backup Direct Connect connection (expensive), or a Site-to-Site VPN connection
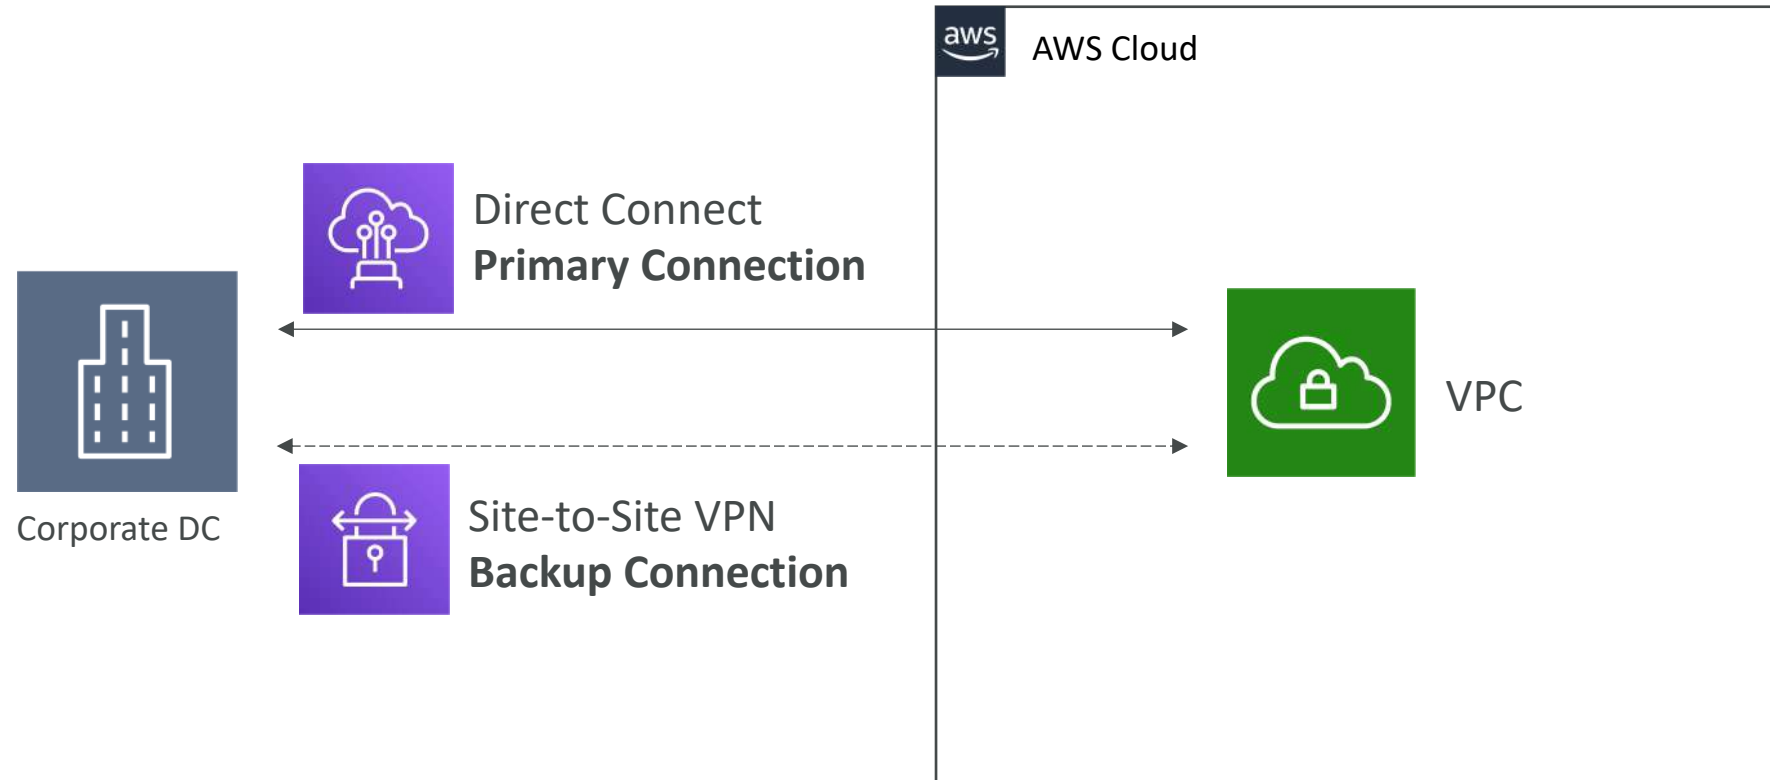

Exposing services in your VPC to other VPC

- Option 1: make it public
  - Goes through the public www
  - Tough to manage access
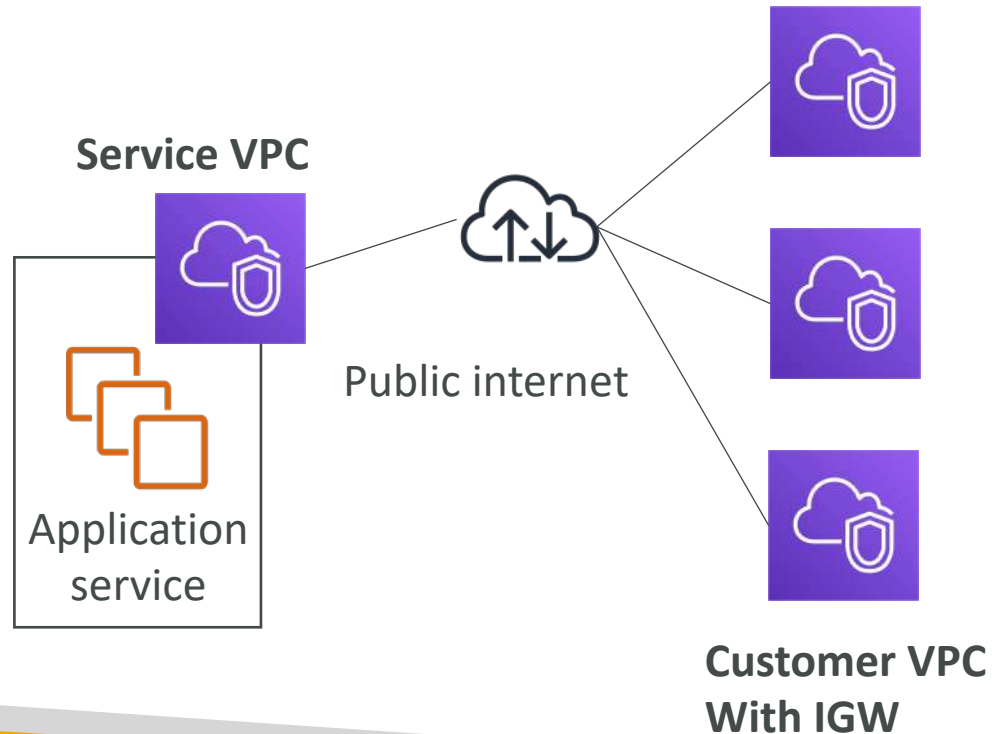

- Option 2: VPC peering
  - Must create many peering relations
  - Opens the **whole** network

Service VPC

Application service

Public internet

Customer VPC With IGW

Peering connection

Service VPC

Application service

Customer VPC
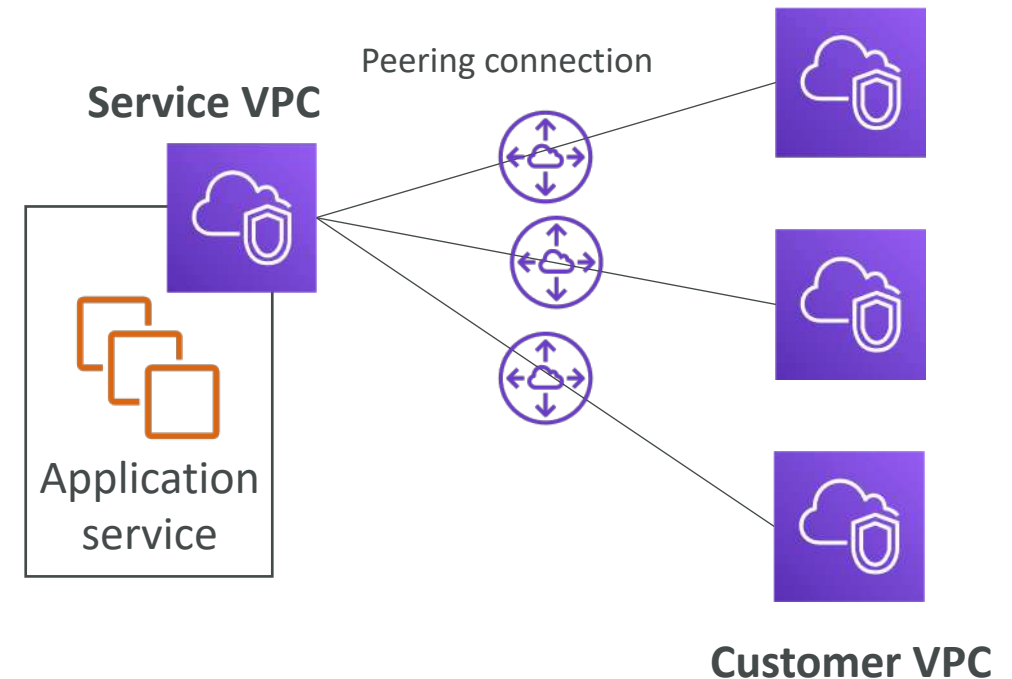

AWS PrivateLink (VPC Endpoint Services)

- Most secure & scalable way to expose a service to 1000s of VPC (own or other accounts)
- Does not require VPC peering, internet gateway, NAT, route tables…
- Requires a network load balancer (Service VPC) and ENI (Customer VPC) or GWLB
- If the NLB is in multiple AZ, and the ENIs in multiple AZ, the solution is fault tolerant!

Service VPC

AWS Private Link

Customer VPC

Application service

Network Load Balancer

AWS private

Elastic Network Interface (ENI)

Consumer Application
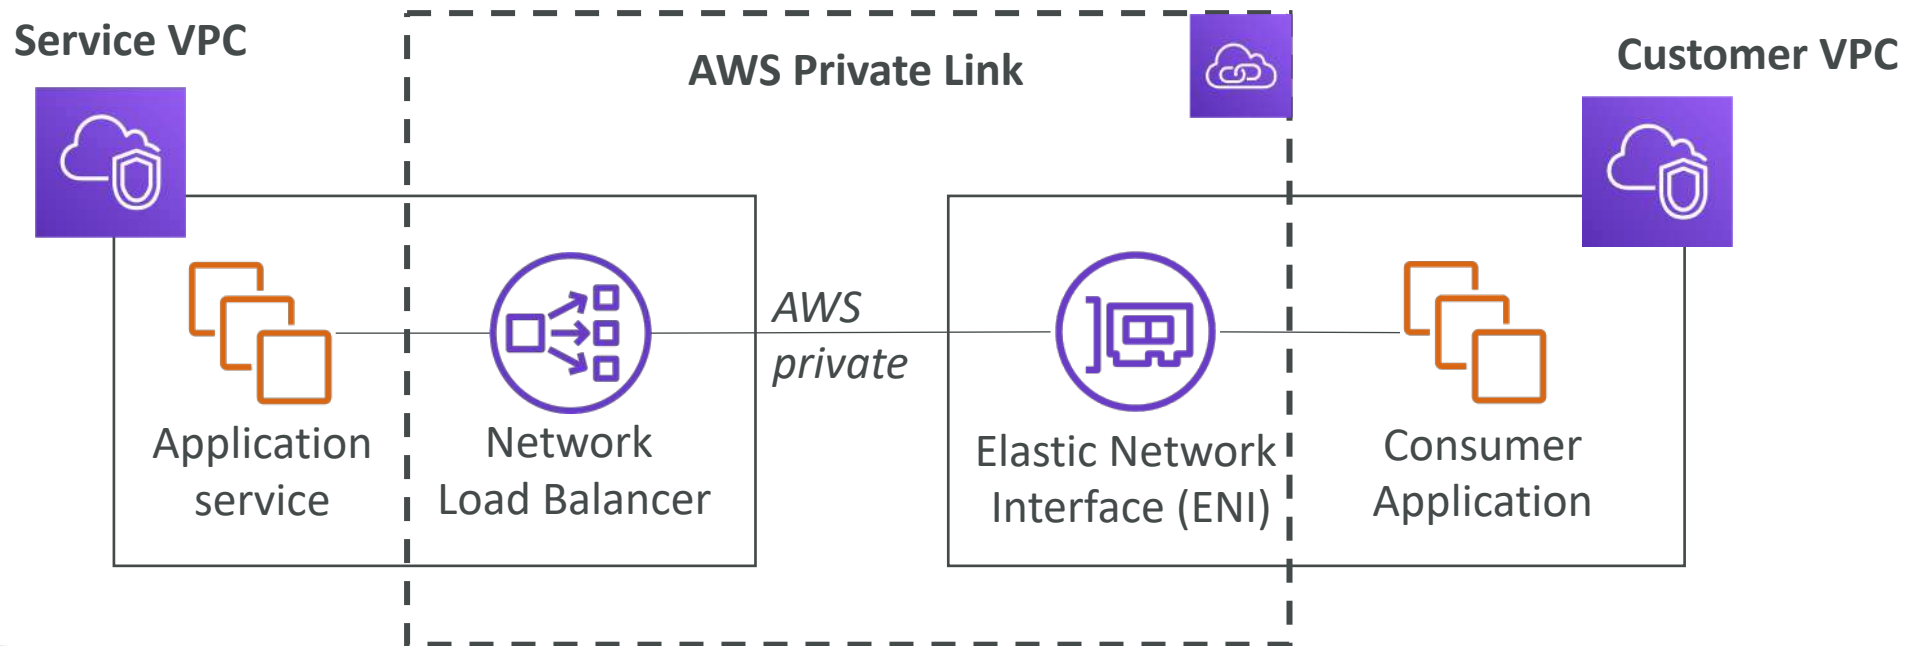

AWS Private Link & ECS
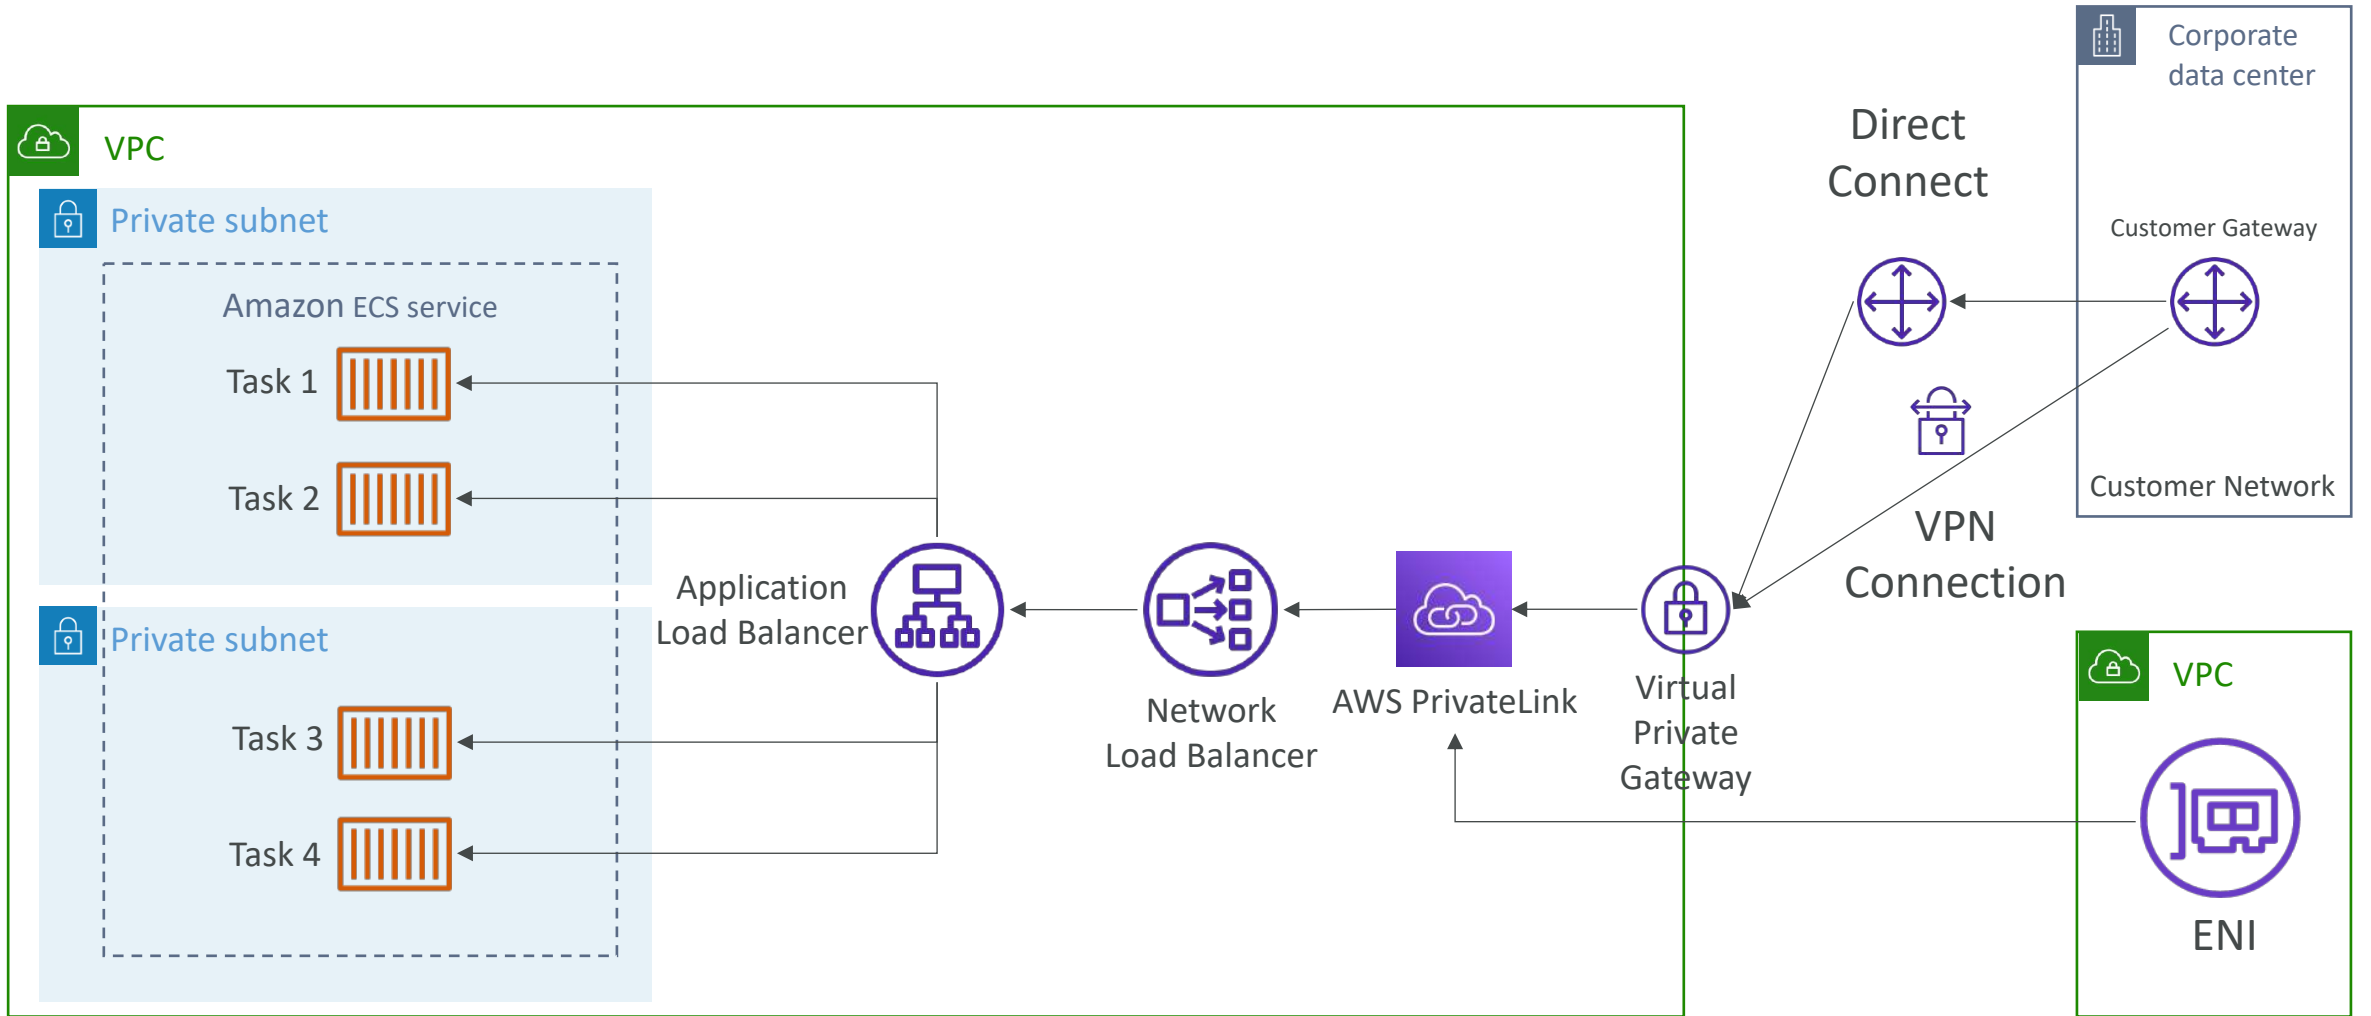

EC2-Classic & AWS ClassicLink (deprecated)

- **EC2-Classic:** instances run in a single network shared with other customers
- **Amazon VPC:** your instances run logically isolated to your AWS account

- **ClassicLink** allows you to link EC2-Classic instances to a VPC in your account
    - Must associate a security group
    - Enables communication using private IPv4 addresses
    - Removes the need to make use of public IPv4 addresses or Elastic IP addresses

- Likely to be distractors at the exam

Network topologies can become complicated
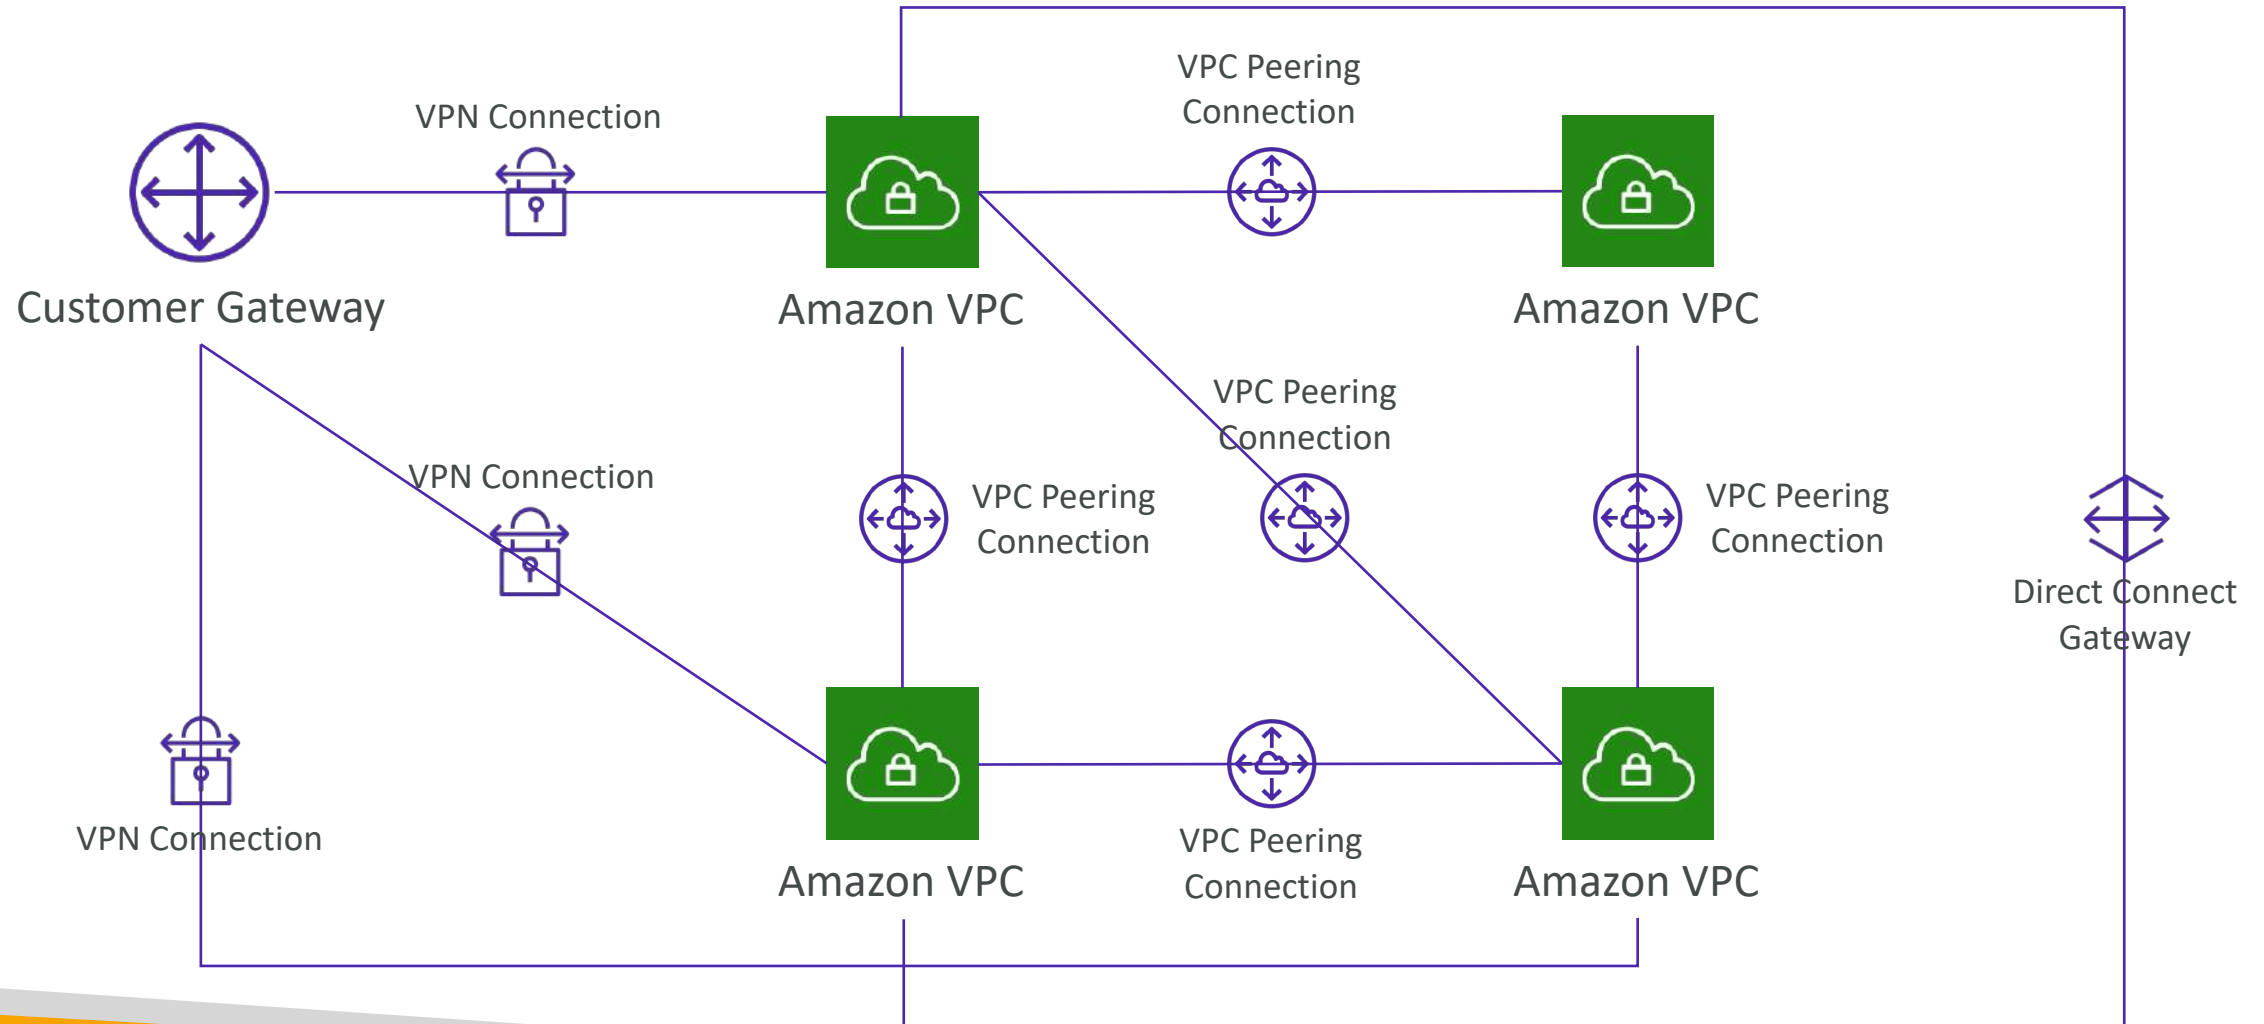

Transit Gateway

- For having transitive peering between thousands of VPC and on-premises, hub-and-spoke (star) connection
- Regional resource, can work cross-region
- Share cross-account using Resource Access Manager (RAM)
- You can peer Transit Gateways across regions
- Route Tables: limit which VPC can talk with other VPC
- Works with Direct Connect Gateway, VPN connections
- Supports **IP Multicast** (not supported by any other AWS service)

AWS Direct
Connect Gateway

Amazon VPC

Amazon VPC

**Transit
Gateway**

Amazon VPC

Amazon VPC

VPN Connection

Customer Gateway
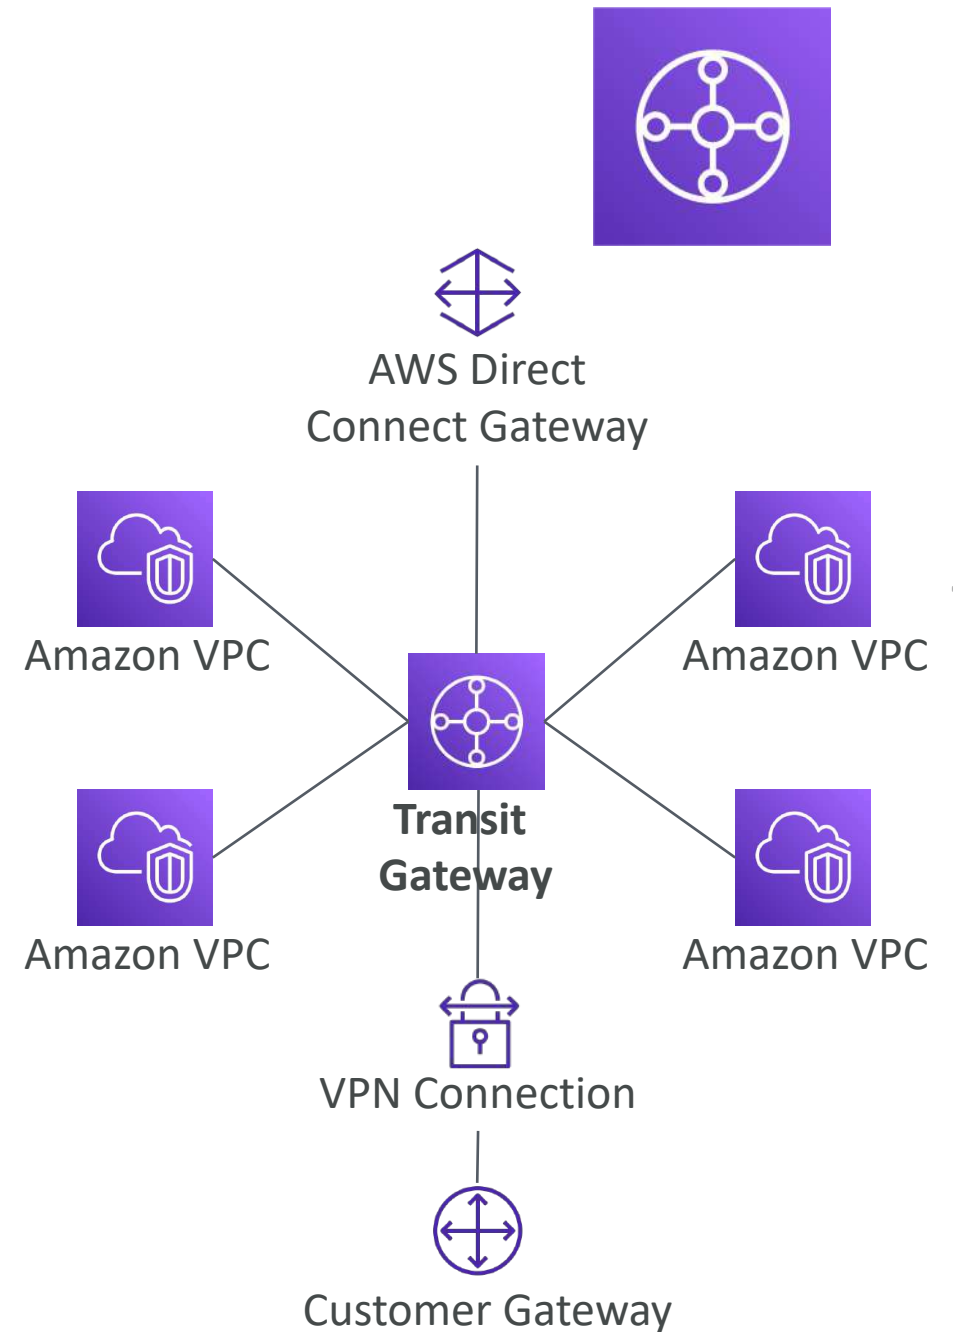

Transit Gateway: Site-to-Site VPN ECMP

- ECMP = Equal-cost multi-path routing
- Routing strategy to allow to forward a packet over multiple best path
- Use case: create multiple Site-to-Site VPN connections **to increase the bandwidth of your connection to AWS**

VPN connection
(2 tunnels)

VPN to transit gateway

1x 🔒 = 1x ⬍ [VPC VPC VPC VPC]
1x 🔒 = 2.5 Gbps (ECMP) – 2 tunnels used

2x 🔒 = 5.0 Gbps (ECMP)

3x 🔒 = 7.5 Gbps (ECMP)

+$$ per GB of TGW
processed data

Transit Gateway – Share Direct Connect between multiple accounts

You can use AWS Resource Access Manager to share Transit Gateway with other accounts.

VPC – Traffic Mirroring

- Allows you to capture and inspect network traffic in your VPC
- Route the traffic to security appliances that you manage
- Capture the traffic
  - **From (Source)** – ENIs
  - **To (Targets)** – an ENI or a Network Load Balancer
- Capture all packets or capture the packets of your interest (optionally, truncate packets)
- Source and Target can be in the same VPC or different VPCs (VPC Peering)
- Use cases: content inspection, threat monitoring, troubleshooting, …

What is IPv6?

- IPv4 designed to provide 4.3 Billion addresses (they'll be exhausted soon)

- IPv6 is the successor of IPv4
- IPv6 is designed to provide 3.4×10^{38} unique IP addresses
- **Every IPv6 address <u>in AWS</u> is public** and Internet-routable (no private range)
- Format ➔ x.x.x.x.x.x.x.x (<u>x</u> is hexadecimal, range can be from 0000 to ffff)
- Examples:
    - 2001:db8:3333:4444:5555:6666:7777:8888
    - 2001:db8:3333:4444:cccc:dddd:eeee:ffff
    - :: ➔ all 8 segments are zero
    - 2001:db8:: ➔ the last 6 segments are zero
    - ::1234:5678 ➔ the first 6 segments are zero
    - 2001:db8::1234:5678 ➔ the middle 4 segments are zero

IPv6 in VPC

- <u>IPv4 cannot be disabled for your VPC and subnets</u>

- You can enable IPv6 (they're public IP addresses) to operate in dual-stack mode

- Your EC2 instances will get at least a private internal IPv4 and a public IPv6

- They can communicate using either IPv4 or IPv6 to the internet through an Internet Gateway

Internet

VPC

Internet
Gateway
IPv4 & IPv6

EC2 Instance
(**Private IP:** 10.0.0.5)
(**IPv6:** *2001:db8::ff00:42:8329*)

IPv6 Troubleshooting

- <u>IPv4 cannot be disabled for your VPC and subnets</u>

- So, if you cannot launch an EC2 instance in your subnet
  - It's not because it cannot acquire an IPv6 (the space is very large)
  - It's because there are no available IPv4 in your subnet

- <u>Solution:</u> create a new IPv4 CIDR in your subnet

User

create

VPC
(IPv4: 192.168.0.0/24)
(IPv4: 10.0.0.0/24)
(IPv6: 2001:db8:1234:5678::/56)

...

192.168.0.10   192.168.0.15

10.0.0.35

Egress-only Internet Gateway

- Used for IPv6 only

- (similar to a NAT Gateway but for IPv6)

- Allows instances in your VPC outbound connections over IPv6 while preventing the internet to initiate an IPv6 connection to your instances

- You must update the Route Tables

Internet

initiate connections from both sides

can't initiate connections from Internet

VPC

Internet Gateway

Egress-only Internet Gateway

Public Subnet

Private Subnet

IPv6: 2001:db8::b1c2

IPv6: 2001:db8::e1c3

IPv6 Routing

VPC Section Summary (1/3)

- **CIDR** – IP Range
- **VPC** – Virtual Private Cloud => we define a list of IPv4 & IPv6 CIDR
- **Subnets** – tied to an AZ, we define a CIDR
- **Internet Gateway** – at the VPC level, provide IPv4 & IPv6 Internet Access
- **Route Tables** – must be edited to add routes from subnets to the IGW, VPC Peering Connections, VPC Endpoints, …
- **Bastion Host** – public EC2 instance to SSH into, that has SSH connectivity to EC2 instances in private subnets
- **NAT Instances** – gives Internet access to EC2 instances in private subnets. Old, must be setup in a public subnet, disable Source / Destination check flag
- **NAT Gateway** – managed by AWS, provides scalable Internet access to private EC2 instances, when the target is an IPv4 address
- **Private DNS + Route 53** – enable DNS Resolution + DNS Hostnames (VPC)

VPC Section Summary (2/3)

- **NACL** – stateless, subnet rules for inbound and outbound, don't forget Ephemeral Ports
- **Security Groups** – stateful, operate at the EC2 instance level
- **Reachability Analyzer** – perform network connectivity testing between AWS resources
- **VPC Peering** – connect two VPCs with non overlapping CIDR, non-transitive
- **VPC Endpoints** – provide private access to AWS Services (S3, DynamoDB, CloudFormation, SSM) within a VPC
- **VPC Flow Logs** – can be setup at the VPC / Subnet / ENI Level, for ACCEPT and REJECT traffic, helps identifying attacks, analyze using Athena or CloudWatch Logs Insights
- **Site-to-Site VPN** – setup a Customer Gateway on DC, a Virtual Private Gateway on VPC, and site-to-site VPN over public Internet
- **AWS VPN CloudHub** – hub-and-spoke VPN model to connect your sites

VPC Section Summary (3/3)

- **Direct Connect** – setup a Virtual Private Gateway on VPC, and establish a direct private connection to an AWS Direct Connect Location
- **Direct Connect Gateway** – setup a Direct Connect to many VPCs in different AWS regions
- **AWS PrivateLink / VPC Endpoint Services:**
  - Connect services privately from your service VPC to customers VPC
  - Doesn't need VPC Peering, public Internet, NAT Gateway, Route Tables
  - Must be used with Network Load Balancer & ENI
- **ClassicLink** – connect EC2-Classic EC2 instances privately to your VPC
- **Transit Gateway** – transitive peering connections for VPC, VPN & DX
- **Traffic Mirroring** – copy network traffic from ENIs for further analysis
- **Egress-only Internet Gateway** – like a NAT Gateway, but for IPv6

www.datacumulus.com

Networking Costs in AWS per GB - Simplified

- Use Private IP instead of Public IP for good savings and better network performance
- Use same AZ for maximum savings (at the cost of high availability)

www.datacumulus.com

© Stephane Maarek

Minimizing egress traffic network cost

- Egress traffic: outbound traffic (from AWS to outside)

- Ingress traffic: inbound traffic - from outside to AWS (typically free)

- Try to keep as much internet traffic within AWS to minimize costs

- Direct Connect location that are co-located in the same AWS Region result in lower cost for egress network

Egress cost is high

S3 Data Transfer Pricing – Analysis for USA

- **S3 ingress:** free
- **S3 to Internet:** $0.09 per GB
- **S3 Transfer Acceleration:**
  - Faster transfer times (50 to 500% better)
  - Additional cost on top of Data Transfer Pricing: +$0.04 to $0.08 per GB
- **S3 to CloudFront:** $0.00 per GB
- **CloudFront to Internet:** $0.085 per GB (slightly cheaper than S3)
  - Caching capability (lower latency)
  - Reduce costs associated with S3 Requests Pricing (7x cheaper with CloudFront)
- **S3 Cross Region Replication:** $0.02 per GB

$0.00 Data transfer out to S3 (same-region)

No cost for using Gateway Endpoint.
$0.01 Data transfer in/out (same-region)

Network Protection on AWS

- To protect network on AWS, we've seen
  - Network Access Control Lists (NACLs)
  - Amazon VPC security groups
  - AWS WAF (protect against malicious requests)
  - AWS Shield & AWS Shield Advanced
  - AWS Firewall Manager (to manage them across accounts)

- But what if we want to protect in a sophisticated way our entire VPC?

AWS Network Firewall

- Protect your entire Amazon VPC

- From Layer 3 to Layer 7 protection
- Any direction, you can inspect
  - VPC to VPC traffic
  - Outbound to internet
  - Inbound from internet
  - To / from Direct Connect & Site-to-Site VPN

- Internally, the AWS Network Firewall uses the AWS Gateway Load Balancer
- Rules can be centrally managed cross-account by AWS Firewall Manager to apply to many VPCs

internet

AWS Network Firewall

VPC

Private subnet

Direct Connect

Corporate DC

VPN connection

Peered VPC

Network Firewall – Fine Grained Controls

- Supports 1000s of rules
  - IP & port - example: 10,000s of IPs filtering
  - Protocol – example: block the SMB protocol for outbound communications
  - Stateful domain list rule groups: only allow outbound traffic to *.mycorp.com or third-party software repo
  - General pattern matching using regex

- **Traffic filtering: Allow, drop, or alert for the traffic that matches the rules**

- **Active flow inspection** to protect against network threats with intrusion-prevention capabilities (like Gateway Load Balancer, but all managed by AWS)

- Send logs of rule matches to Amazon S3, CloudWatch Logs, Kinesis Data Firehose

Amazon Route 53

What is DNS?

- Domain Name System which translates the human friendly hostnames into the machine IP addresses

- www.google.com => 172.217.18.36

- DNS is the backbone of the Internet

- DNS uses hierarchical naming structure

.com

example.com

www.example.com

api.example.com

DNS Terminologies

- **Domain Registrar:** Amazon Route 53, GoDaddy, …
- **DNS Records:** A, AAAA, CNAME, NS, …
- **Zone File:** contains DNS records
- **Name Server:** resolves DNS queries (Authoritative or Non-Authoritative)
- **Top Level Domain (TLD):** .com, .us, .in, .gov, .org, …
- **Second Level Domain (SLD):** amazon.com, google.com, …

Amazon Route 53

- A highly available, scalable, fully managed and *Authoritative* DNS
  - Authoritative = the customer (you) can update the DNS records
- Route 53 is also a Domain Registrar
- Ability to check the health of your resources
- The only AWS service which provides 100% availability SLA
- Why Route 53? 53 is a reference to the traditional DNS port

Client

example.com? → Amazon Route 53

54.22.33.44 ←

AWS Cloud

EC2 Instance
Public IP
54.22.33.44

Route 53 – Records

- How you want to route traffic for a domain

- Each record contains:
  - **Domain/subdomain Name** – e.g., example.com
  - **Record Type** – e.g., A or AAAA
  - **Value** – e.g., 12.34.56.78
  - **Routing Policy** – how Route 53 responds to queries
  - **TTL** – amount of time the record cached at DNS Resolvers

- Route 53 supports the following DNS record types:
  - (must know) A / AAAA / CNAME / NS
  - (advanced) CAA / DS / MX / NAPTR / PTR / SOA / TXT / SPF / SRV

Route 53 – Record Types

- **A** – maps a hostname to IPv4

- **AAAA** – maps a hostname to IPv6

- **CNAME** – maps a hostname to another hostname
  - The target is a domain name which must have an A or AAAA record
  - Can't create a CNAME record for the top node of a DNS namespace (Zone Apex)
  - Example: you can't create for example.com, but you can create for www.example.com

- **NS** – Name Servers for the Hosted Zone
  - Control how traffic is routed for a domain

Route 53 – Hosted Zones

- A container for records that define how to route traffic to a domain and its subdomains

- **Public Hosted Zones** – contains records that specify how to route traffic on the Internet (public domain names)
  application1.mypublicdomain.com

- **Private Hosted Zones** – contain records that specify how you route traffic within one or more VPCs (private domain names)
  application1.company.internal

- You pay $0.50 per month per hosted zone

Route 53 – Public vs. Private Hosted Zones

Route 53 – Records TTL (Time To Live)

- High TTL – e.g., 24 hr
  - Less traffic on Route 53
  - Possibly outdated records
- Low TTL – e.g., 60 sec.
  - More traffic on Route 53 ($$)
  - Records are outdated for less time
  - Easy to change records
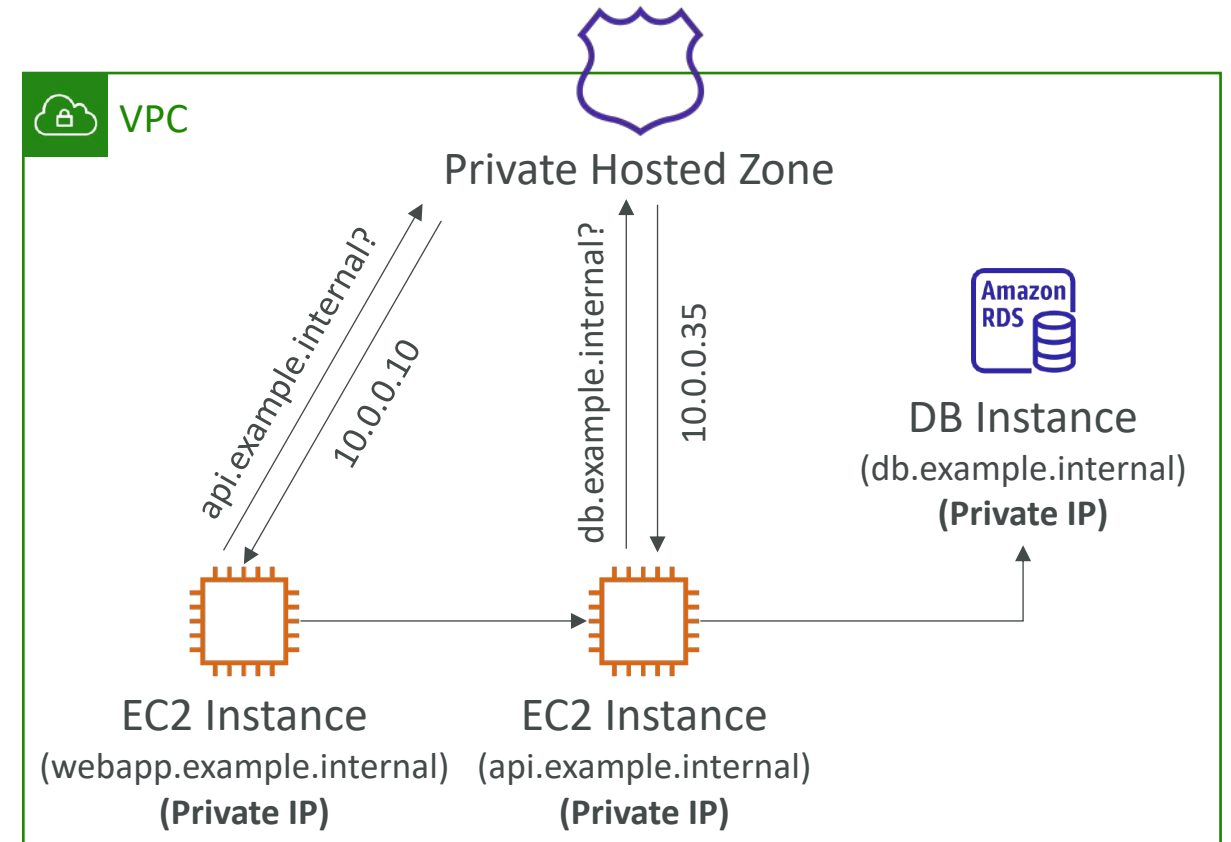

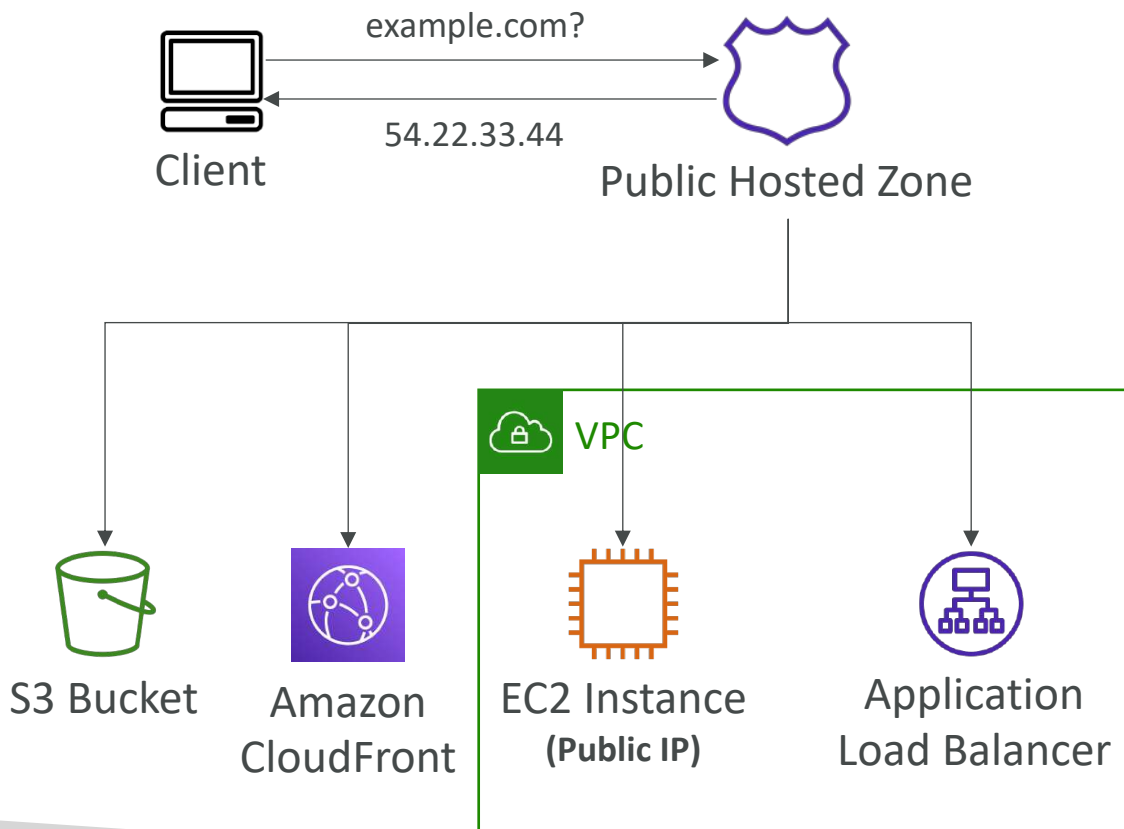

- Except for Alias records, TTL is mandatory for each DNS record

DNS Request
myapp.example.com?

Will cache the result for The TTL of the record

HTTP Request

HTTP Response

Amazon Route 53

Web Server
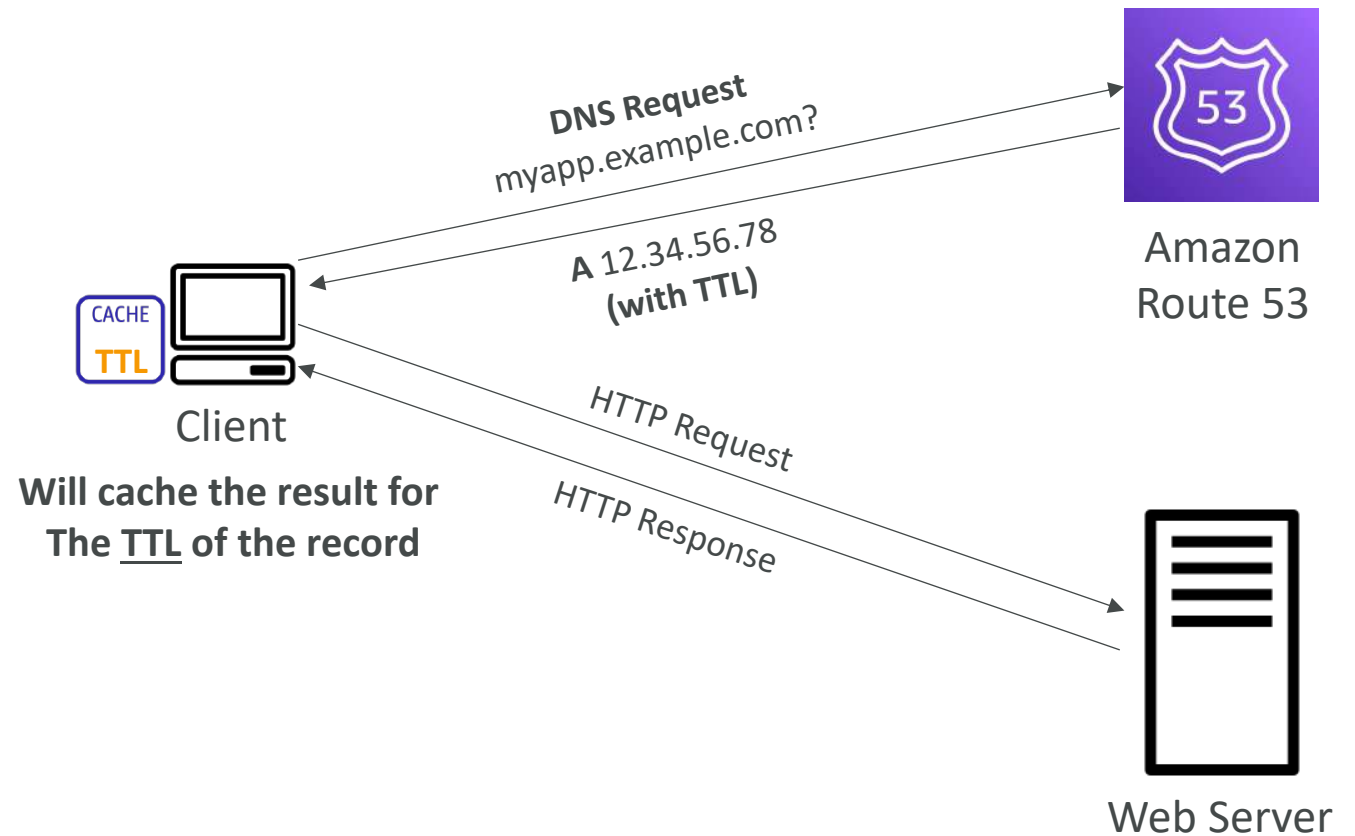

CNAME vs Alias

- AWS Resources (Load Balancer, CloudFront...) expose an AWS hostname:
  - lb1-1234.us-east-2.elb.amazonaws.com and you want myapp.mydomain.com

- CNAME:
  - Points a hostname to any other hostname. (app.mydomain.com => blabla.anything.com)
  - ONLY FOR NON ROOT DOMAIN (aka. something.mydomain.com)

- Alias:
  - Points a hostname to an AWS Resource (app.mydomain.com => blabla.amazonaws.com)
  - Works for ROOT DOMAIN and NON ROOT DOMAIN (aka mydomain.com)
  - Free of charge
  - Native health check

Route 53 – Alias Records

- Maps a hostname to an AWS resource

- An extension to DNS functionality

- Automatically recognizes changes in the resource's IP addresses

- Unlike CNAME, it can be used for the top node of a DNS namespace (Zone Apex), e.g.: example.com

- Alias Record is always of type A/AAAA for AWS resources (IPv4 / IPv6)

- You can't set the TTL

Amazon
Route 53

Alias Record (Enabled)

Record Name	Type	Value
example.com	A	MyALB-123456789.us-east-1.elb.amazonaws.com

MyALB-123456789.us-east-1.elb.amazonaws.com

AWS-Managed
(IP Addresses might change)

Application
Load Balancer
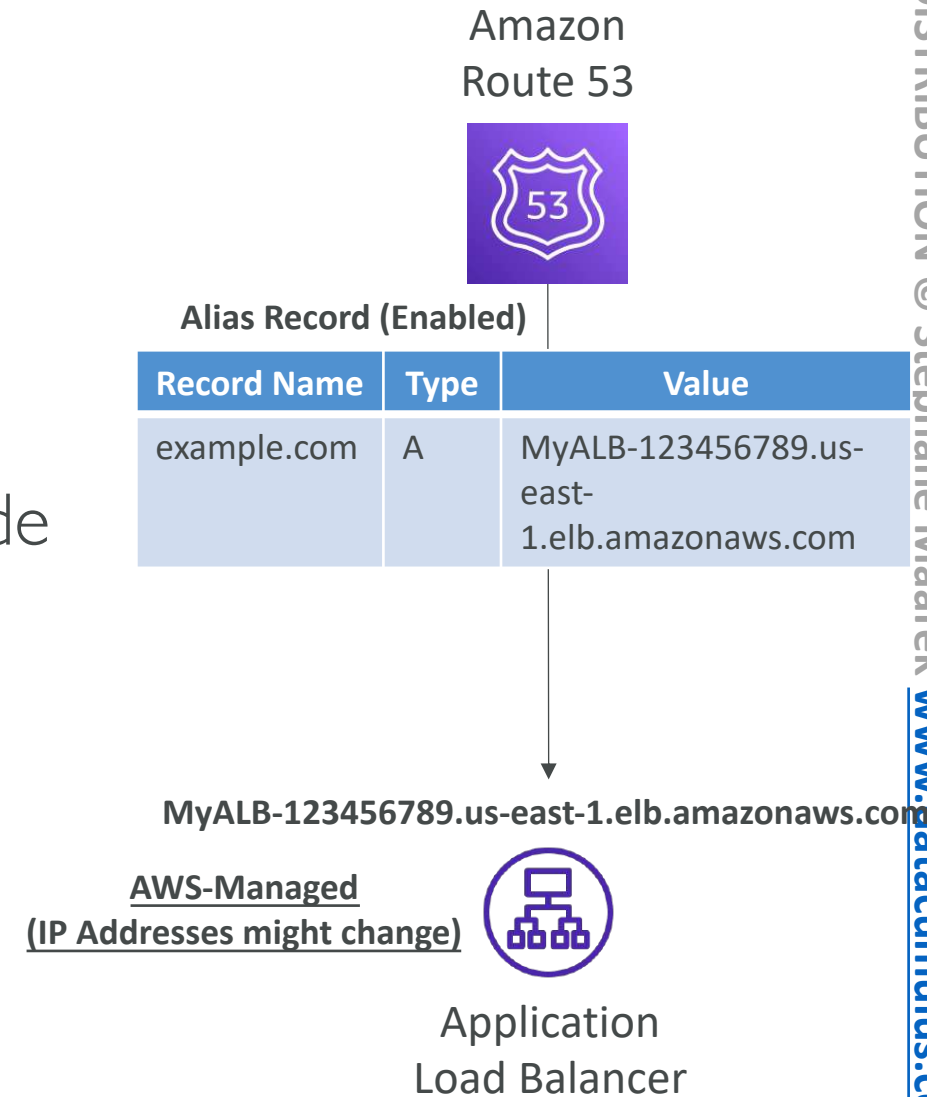

Route 53 – Alias Records Targets

- Elastic Load Balancers
- CloudFront Distributions
- API Gateway
- Elastic Beanstalk environments
- S3 Websites
- VPC Interface Endpoints
- Global Accelerator accelerator
- Route 53 record in the same hosted zone

- You cannot set an ALIAS record for an EC2 DNS name

**Elastic
Load Balancer**
**Amazon
CloudFront**
**Amazon
API Gateway**

Elastic Beanstalk

S3 Websites
**VPC Interface
Endpoints**

Global Accelerator

**Route 53 Record
(same Hosted Zone)**

Route 53 – Routing Policies

- Define how Route 53 responds to DNS queries

- Don't get confused by the word *"Routing"*
  - It's not the same as Load balancer routing which routes the traffic
  - DNS does not route any traffic, it only responds to the DNS queries

- Route 53 Supports the following Routing Policies
  - Simple
  - Weighted
  - Failover
  - Latency based
  - Geolocation
  - Multi-Value Answer
  - Geoproximity (using Route 53 Traffic Flow feature)

Routing Policies – Simple

- Typically, route traffic to a single resource
- Can specify multiple values in the same record
- **If multiple values are returned, a random one is chosen by the <u>client</u>**
- When Alias enabled, specify only one AWS resource
- Can't be associated with Health Checks

<u>Single Value</u>

Client → foo.example.com → Amazon Route 53
Client ← **A** 11.22.33.44 ← Amazon Route 53

Multiple Value

Client → foo.example.com → Amazon Route 53
Client ← **A** 11.22.33.44
A 55.66.77.88
A 99.11.22.33 ← Amazon Route 53

Client **chooses a random value**
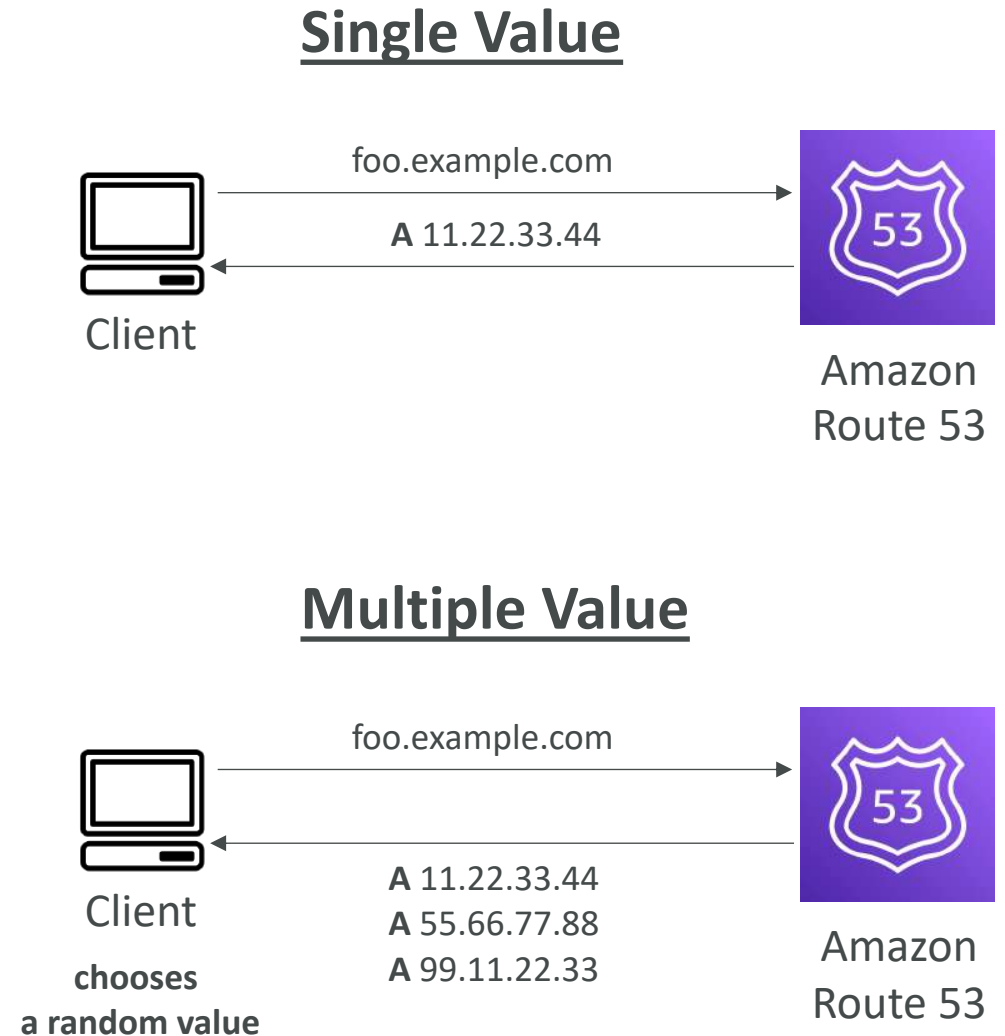

Routing Policies – Weighted

- Control the % of the requests that go to each specific resource
- Assign each record a relative weight:
  - $traffic\ (\%) = \dfrac{Weight\ for\ a\ specific\ record}{Sum\ of\ all\ the\ weights\ for\ all\ records}$
  - Weights don't need to sum up to 100
- DNS records must have the same name and type
- Can be associated with Health Checks
- Use cases: load balancing between regions, testing new application versions…
- Assign a weight of 0 to a record to stop sending traffic to a resource
- If all records have weight of 0, then all records will be returned equally

70%

Weight: 70

Amazon
Route 53

20%

Weight: 20

10%

Weight: 10
Routing Policies – Latency-based

- Redirect to the resource that has the least latency close to us
- Super helpful when latency for users is a priority
- **Latency is based on traffic between users and AWS Regions**
- Germany users may be directed to the US (if that's the lowest latency)
- Can be associated with Health Checks (has a failover capability)

ALB
(us-east-1)

ALB
(ap-southeast-1)

www.datacumulus.com
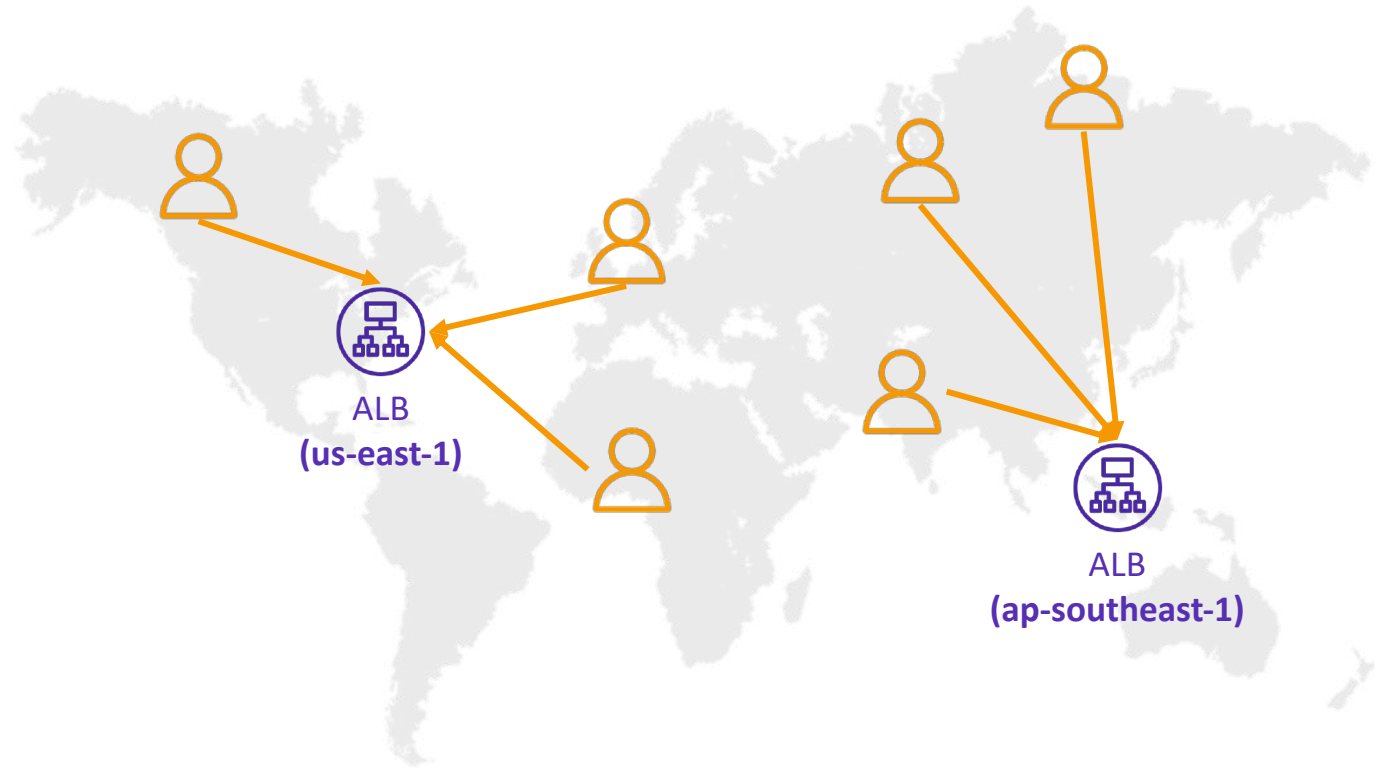

Route 53 – Health Checks

- HTTP Health Checks are only for **public resources**

- Health Check => Automated DNS Failover:
  1. Health checks that monitor an endpoint (application, server, other AWS resource)
  2. Health checks that monitor other health checks (Calculated Health Checks)
  3. Health checks that monitor CloudWatch Alarms (full control !!) – e.g., throttles of DynamoDB, alarms on RDS, custom metrics, … (helpful for private resources)

- Health Checks are integrated with CW metrics

EC2 Instance

eu-west-1
ALB
Auto Scaling group
EC2 Instance
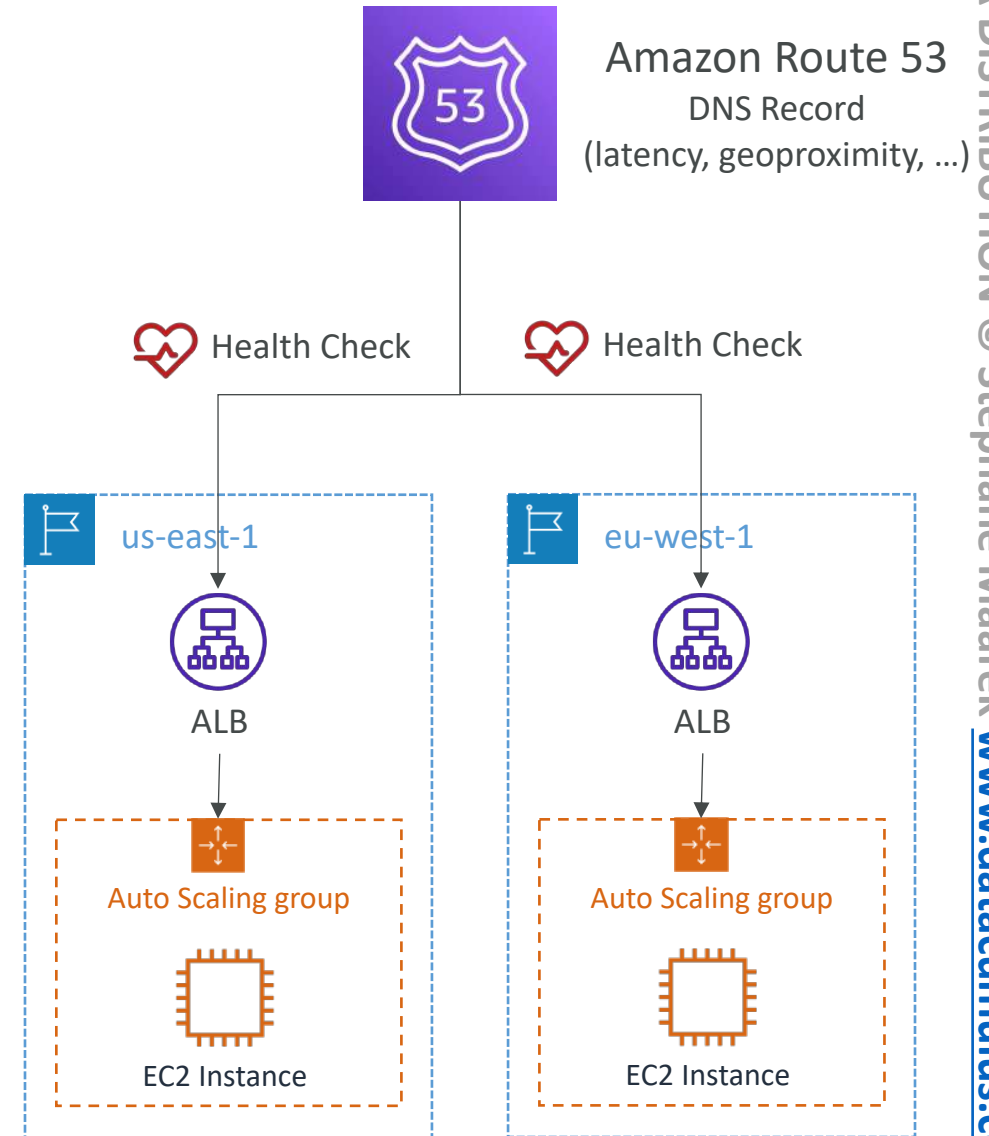

Health Checks – Monitor an Endpoint

- **About 15 global health checkers will check the endpoint health**
  - Healthy/Unhealthy Threshold – 3 (default)
  - Interval – 30 sec (can set to 10 sec – higher cost)
  - Supported protocol: HTTP, HTTPS and TCP
  - If > 18% of health checkers report the endpoint is healthy, Route 53 considers it **Healthy**. Otherwise, it's **Unhealthy**
  - Ability to choose which locations you want Route 53 to use
- **Health Checks pass only when the endpoint responds with the 2xx and 3xx status codes**
- **Health Checks can be setup to pass / fail based on the text in the first 5120 bytes of the response**
- **Configure you router/firewall to allow incoming requests from Route 53 Health Checkers**

DNS Requests

Amazon
Route 53

Health Check
(mandatory)

Failover

EC2 Instance
(Primary)

EC2 Instance
(Secondary – Disaster Recovery)
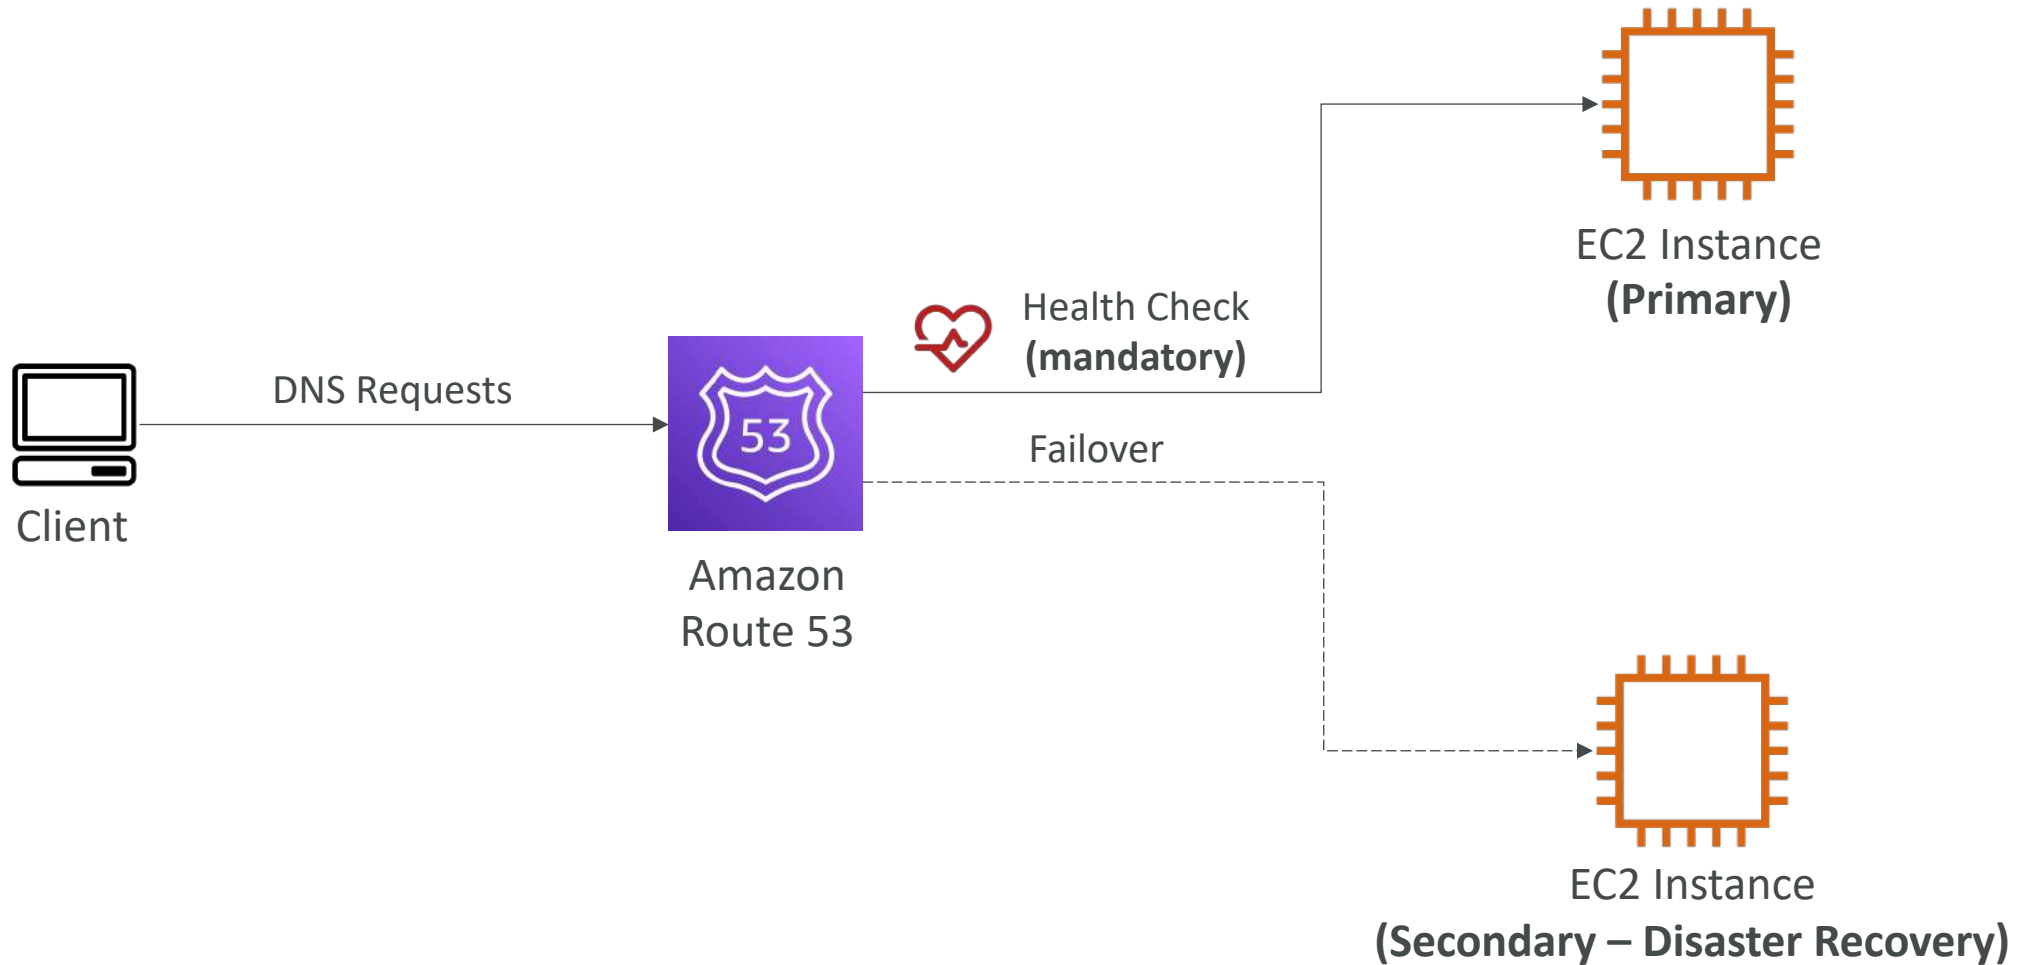

Routing Policies – Geolocation

- Different from Latency-based!

- **This routing is based on user location**

- Specify location by Continent, Country or by US State (if there's overlapping, most precise location selected)

- Should create a **"Default"** record (in case there's no match on location)

- Use cases: website localization, restrict content distribution, load balancing, …

- Can be associated with Health Checks

A 11.22.33.44

Default
A 99.11.22.33

A 55.66.77.88

Routing Policies – Geoproximity

- Route traffic to your resources based on the geographic location of users and resources

- Ability **to shift more traffic to resources based** on the defined **bias**

- To change the size of the geographic region, specify **bias** values:
  - To expand (1 to 99) – more traffic to the resource
  - To shrink (-1 to -99) – less traffic to the resource

- Resources can be:
  - AWS resources (specify AWS region)
  - Non-AWS resources (specify Latitude and Longitude)
- You must use Route 53 **Traffic Flow** to use this feature

Routing Policies – Geoproximity

Routing Policies – Geoproximity

us-west-1
Bias: 0

us-east-1
Bias: 50

Higher bias in us-east-1
Route 53 – Traffic flow

- Simplify the process of creating and maintaining records in large and complex configurations

- Visual editor to manage complex routing decision trees

- Configurations can be saved as **Traffic Flow Policy**
  - Can be applied to different Route 53 Hosted Zones (different domain names)
  - Supports versioning
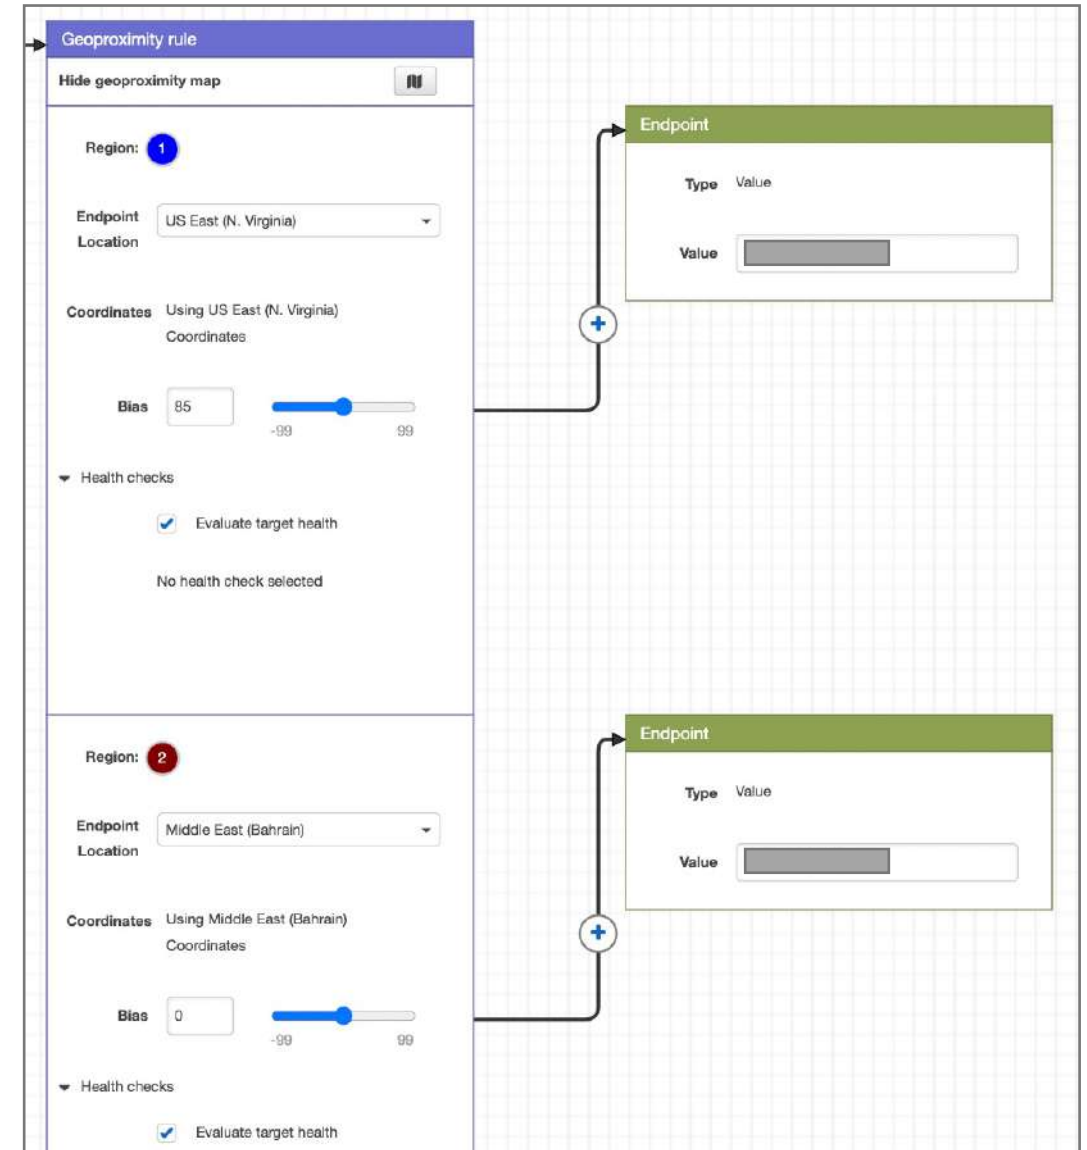

Routing Policies – IP-based Routing

- Routing is based on clients' IP addresses

- You provide a list of CIDRs for your clients and the corresponding endpoints/locations (user-IP-to-endpoint mappings)

- Use cases: Optimize performance, reduce network costs…

- Example: route end users from a particular ISP to a specific endpoint

User B
(200.5.4.100)

User A
(203.0.113.56)

Route 53

CIDR Collection

Locations	CIDR blocks
location-1	203.0.113.0/24
location-2	200.5.4.0/24

Records

Record Name	Value	IP-based
example.com	1.2.3.4	location-1
example.com	5.6.7.8	location-2

EC2 Instance
(5.6.7.8)

EC2 Instance
(1.2.3.4)
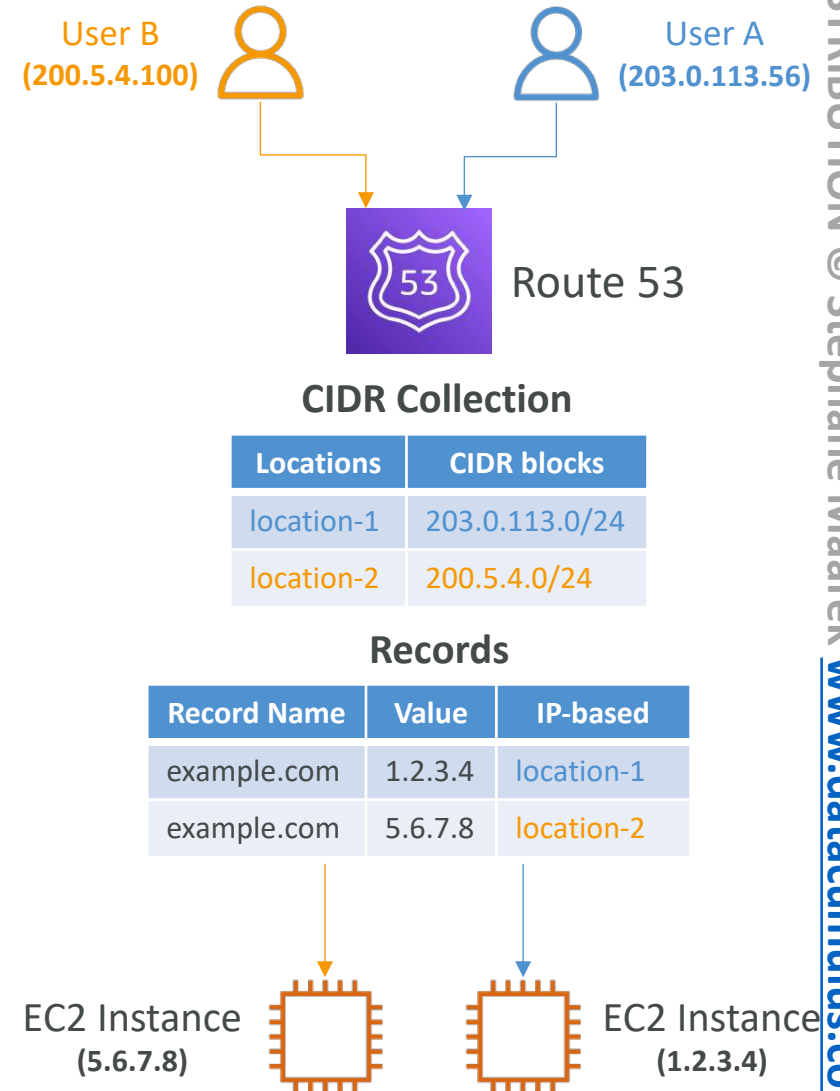

Routing Policies – Multi-Value

- Use when routing traffic to multiple resources
- Route 53 return multiple values/resources
- Can be associated with Health Checks (return only values for healthy resources)
- Up to 8 healthy records are returned for each Multi-Value query
- **Multi-Value is not a substitute for having an ELB**

Name	Type	Value	TTL	Set ID	Health Check
www.example.com	A Record	192.0.2.2	60	Web1	A
www.example.com	A Record	198.51.100.2	60	Web2	B
www.example.com	A Record	203.0.113.2	60	Web3	C

Domain Registar vs. DNS Service

- You buy or register your domain name with a Domain Registrar typically by paying annual charges (e.g., GoDaddy, Amazon Registrar Inc., ...)
- The Domain Registrar usually provides you with a DNS service to manage your DNS records
- But you can use another DNS service to manage your DNS records
- Example: purchase the domain from GoDaddy and use Route 53 to manage your DNS records

purchase **example.com**

User

manage DNS records

Amazon Route 53
GoDaddy as Registrar & Route 53 as DNS Service

© Stephane Maarek

3rd Party Registrar with Amazon Route 53

- If you buy your domain on a 3rd party registrar, you can still use Route 53 as the DNS Service provider

1. Create a Hosted Zone in Route 53
2. Update NS Records on 3rd party website to use Route 53 **Name Servers**

- Domain Registrar != DNS Service
- But every Domain Registrar usually comes with some DNS features

S3 Website with Route 53

For acme.example.com:

- Create an S3 bucket with the **same name** as the target record (acme.example.com)

- Enable S3 website on the bucket (and enable S3 bucket public settings)

- Create a Route 53 **Alias record** to the S3 website endpoint or type A – IPv4 address

- This only works for HTTP traffic (for HTTPS, use CloudFront)

Users

http://acme.example.com

Alias Record	
Record name	acme.example.com
Type	A
Value	s3-website.**eu-central-1**.amazonaws.com

Amazon Route 53

S3 Bucket -
Static Website Hosting Enabled
(acme.example.com)
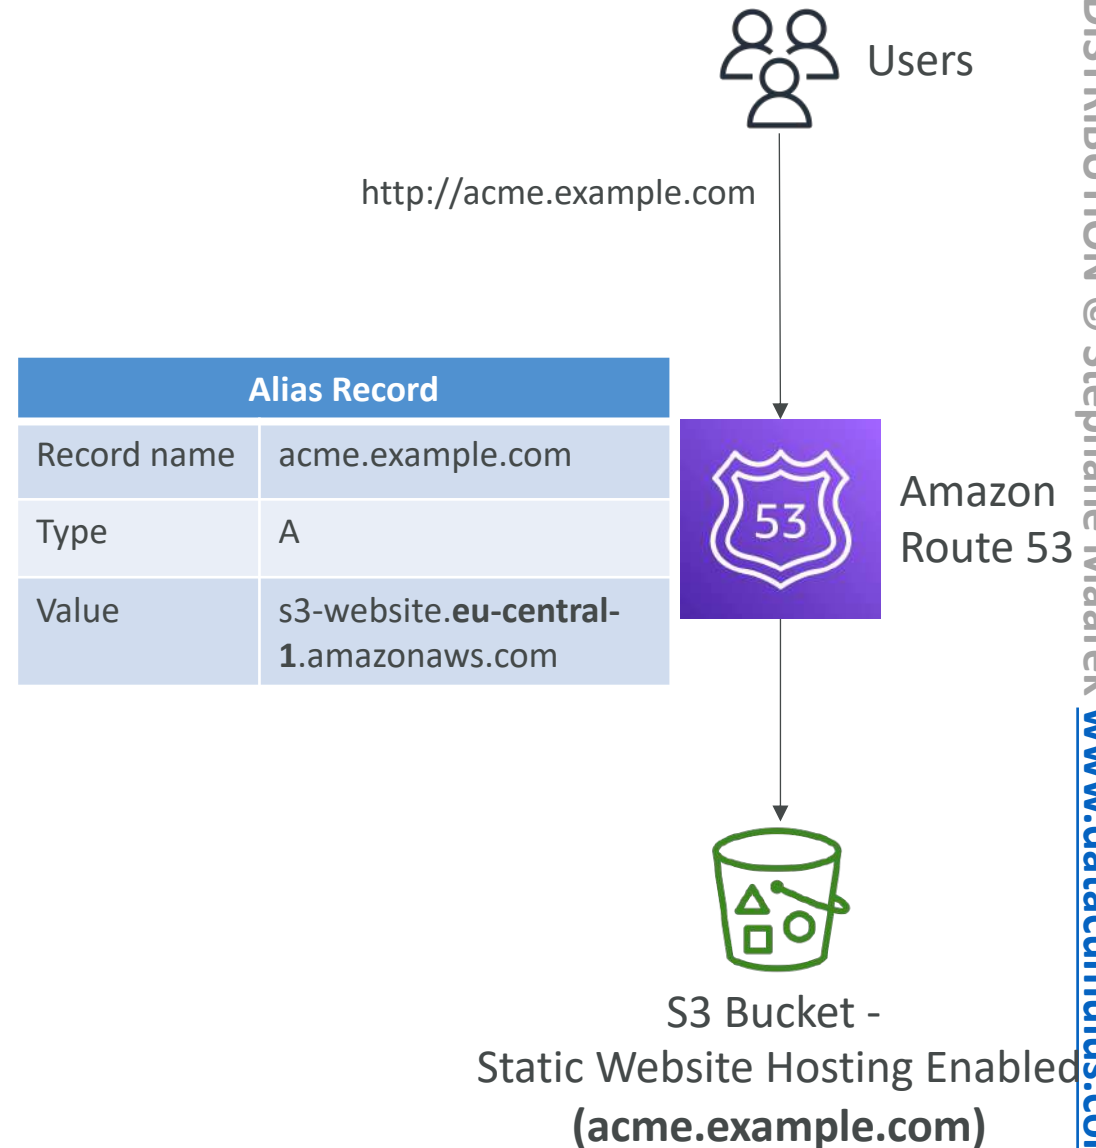

Route 53 – Hybrid DNS

- By default, Route 53 Resolver automatically answers DNS queries for:
  - Local domain names for EC2 instances
  - Records in Private Hosted Zones
  - Records in public Name Servers

- **Hybrid DNS** – resolving DNS queries between VPC (Route 53 Resolver) and your networks (other DNS Resolvers)
- Networks can be:
  - VPC itself / Peered VPC
  - On-premises Network (connected through Direct Connect or AWS VPN)

Public Name Server

Region

VPC

Private Hosted Zone

Route 53 Resolver

EC2 Instance
(ec2-192-0-2-44.compute-1.amazonaws.com)
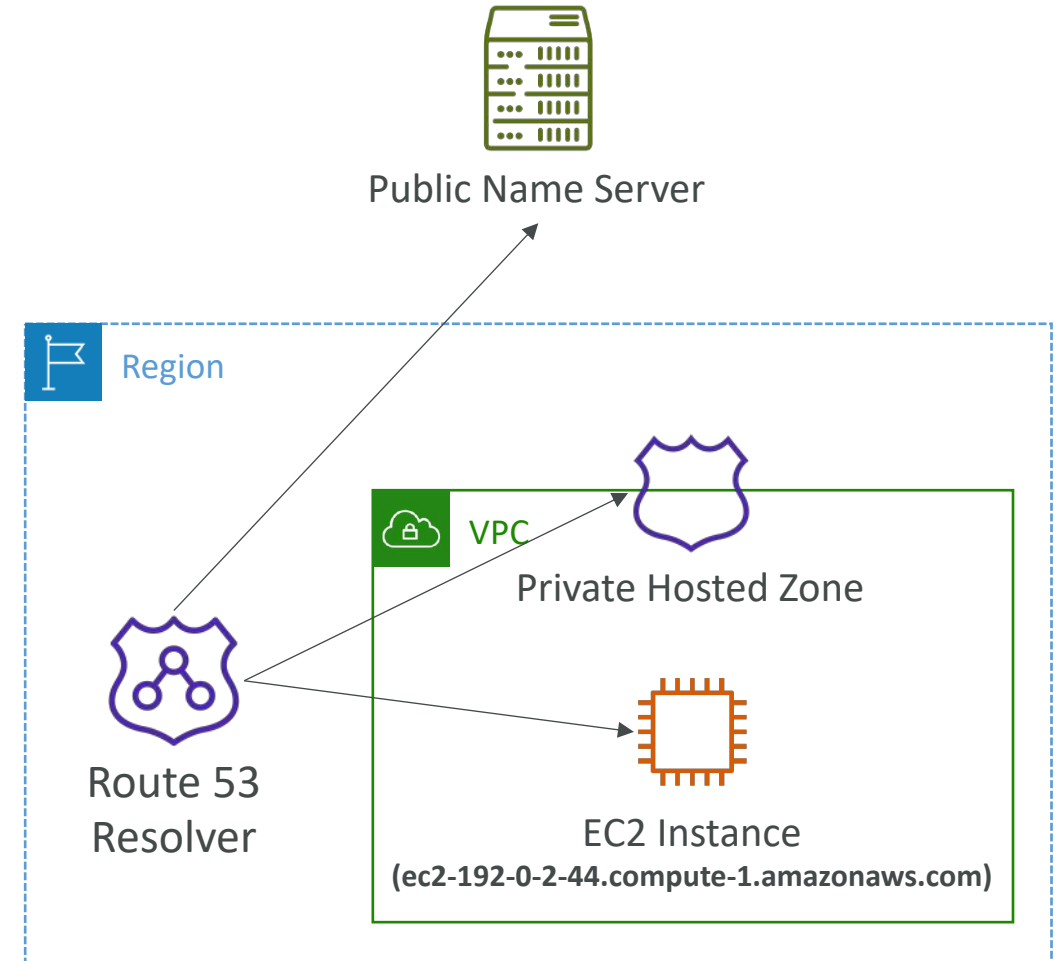

Route 53 – Resolver Endpoints

- Inbound Endpoint
  - DNS Resolvers on your network can forward DNS queries to Route 53 Resolver
  - Allows your DNS Resolvers to resolve domain names for AWS resources (e.g., EC2 instances) and records in Route 53 Private Hosted Zones

- Outbound Endpoint
  - Route 53 Resolver conditionally forwards DNS queries to your DNS Resolvers
  - Use **Resolver Rules** to forward DNS queries to your DNS Resolvers

- Associated with one or more VPCs in the same AWS Region

- Create in two AZs for high availability

- Each Endpoint supports 10,000 queries per second per IP address

Route 53 – Resolver Inbound Endpoints
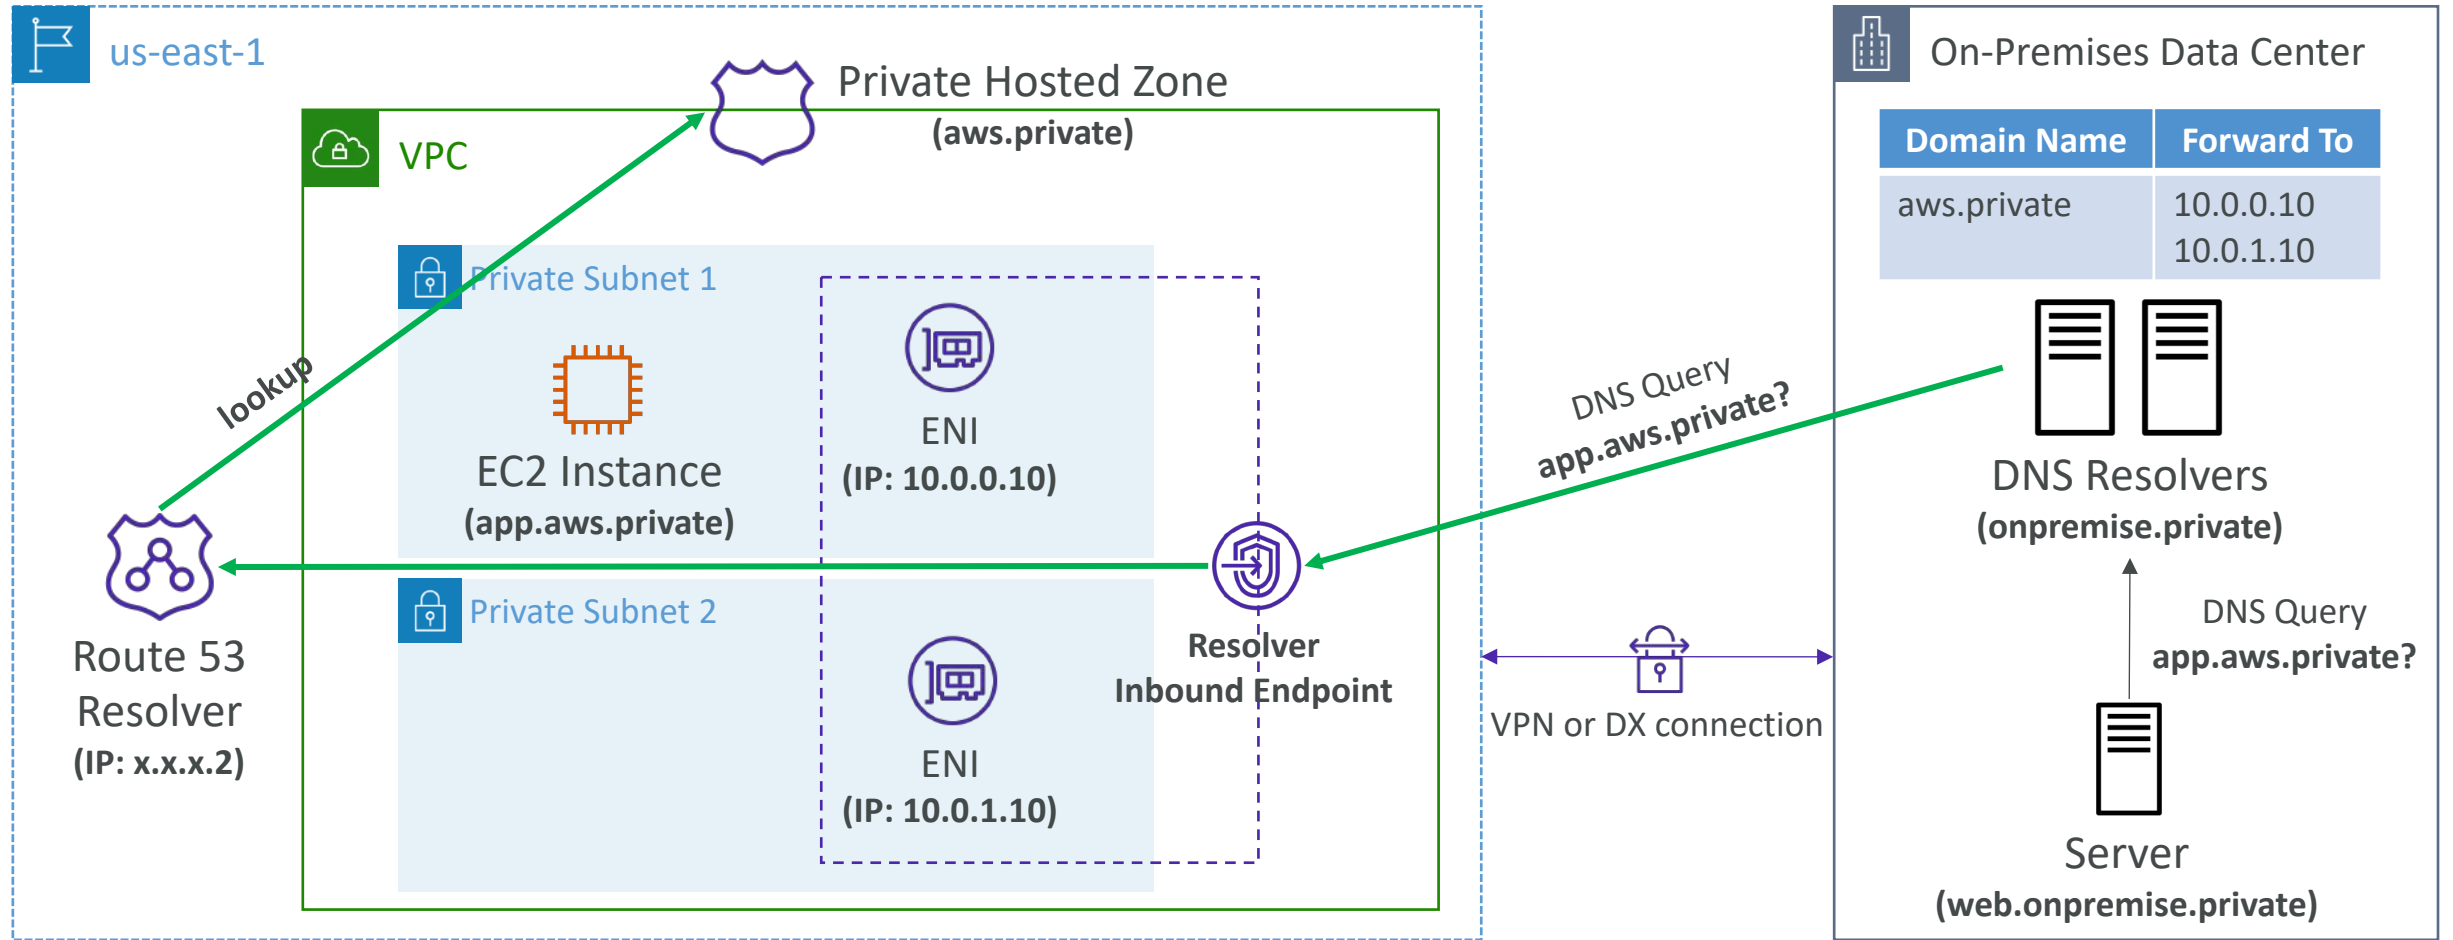

Route 53 – Resolver Outbound Endpoints
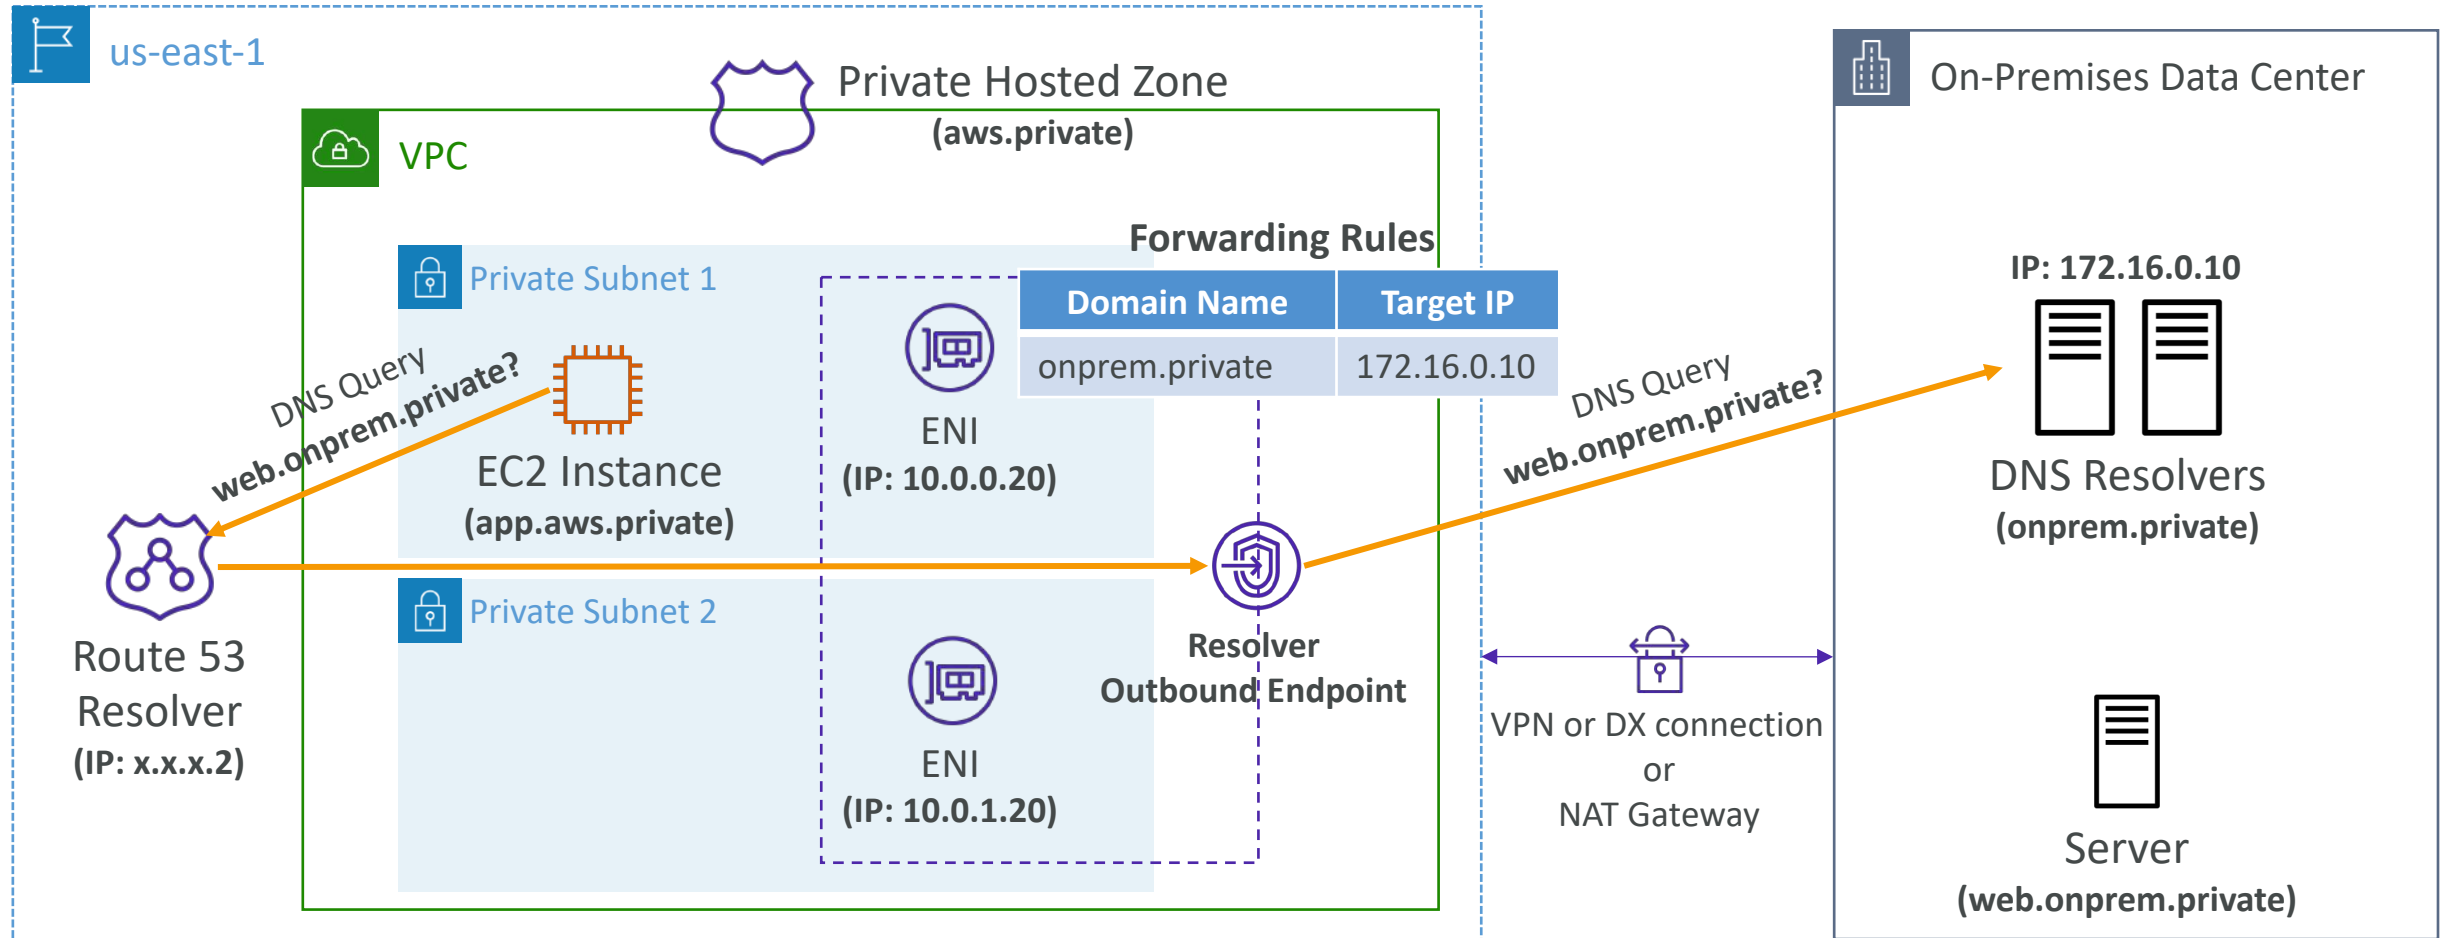

Route 53 – Resolver Rules

- Control which DNS queries are forwarded to DNS Resolvers on your network
- Conditional Forwarding Rules (Forwarding Rules)
  - Forward DNS queries for a specified domain and all its subdomains to target IP addresses
- System Rules
  - Selectively overriding the behavior defined in Forwarding Rules (e.g., don't forward DNS queries for a subdomain acme.example.com)
- Auto-defined System Rules
  - Defines how DNS queries for selected domains are resolved (e.g., AWS internal domain names, Privated Hosted Zones)
- If multiple rules matched, Route 53 Resolver chooses the most specific match
- Resolver Rules can be shared across accounts using AWS RAM
  - Manage them centrally in one account
  - Send DNS queries from multiple VPC to the target IP defined in the rule

Resolver Outbound Endpoint

Forwarding Rules

Domain Name	Target IP
example.com	172.16.0.10
acme.example.com	172.16.0.10

overrides

ec2.internal
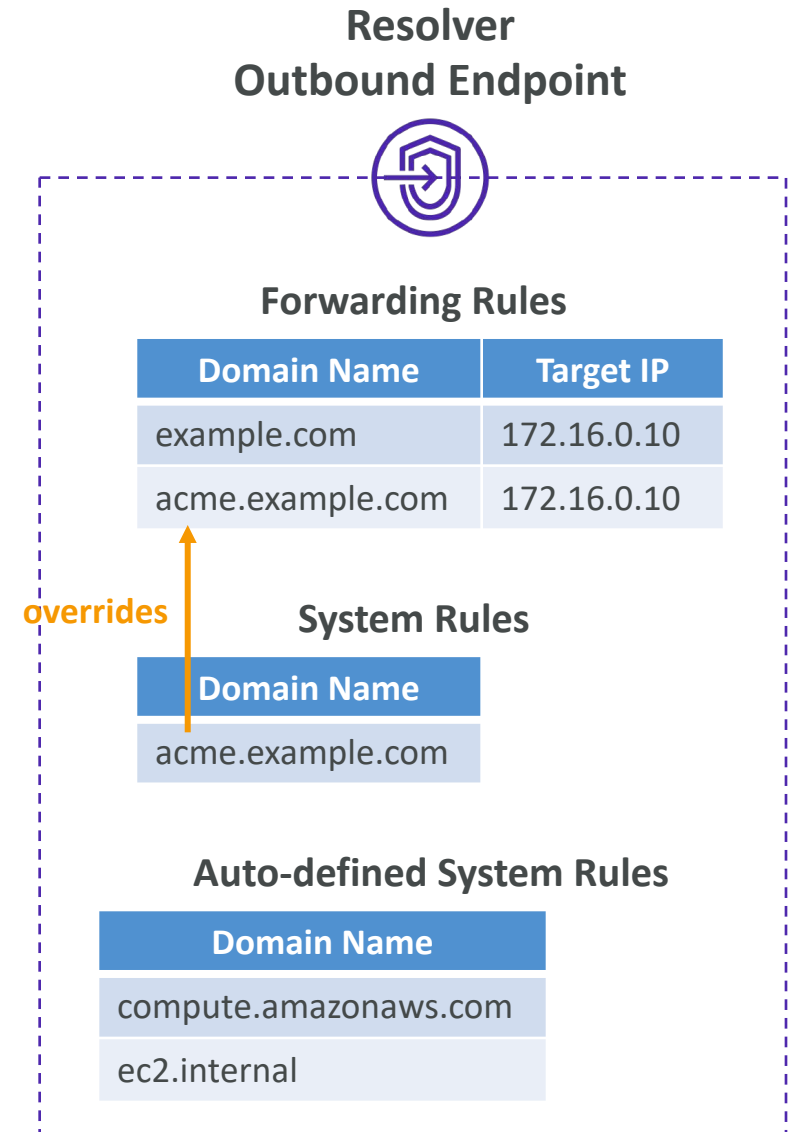

Other Services

AWS X-Ray

- Debugging in Production, the good old way:
  - Test locally
  - Add log statements everywhere
  - Re-deploy in production

- Log formats differ across applications and log analysis is hard.

- Debugging: one big monolith "easy", distributed services "hard"

- No common views of your entire architecture

- Enter… AWS X-Ray!

AWS X-Ray
Visual analysis of our applications

AWS X-Ray advantages

- Troubleshooting performance (bottlenecks)
- Understand dependencies in a microservice architecture
- Pinpoint service issues
- Review request behavior
- Find errors and exceptions
- Are we meeting time SLA?
- Where I am throttled?
- Identify users that are impacted

AWS Amplify - web and mobile applications

- A set of tools and services that helps you develop and deploy scalable full stack web and mobile applications
- Authentication, Storage, API (REST, GraphQL), CI/CD, PubSub, Analytics, AI/ML Predictions, Monitoring, …
- Connect your source code from GitHub, AWS CodeCommit, Bitbucket, GitLab, or upload directly
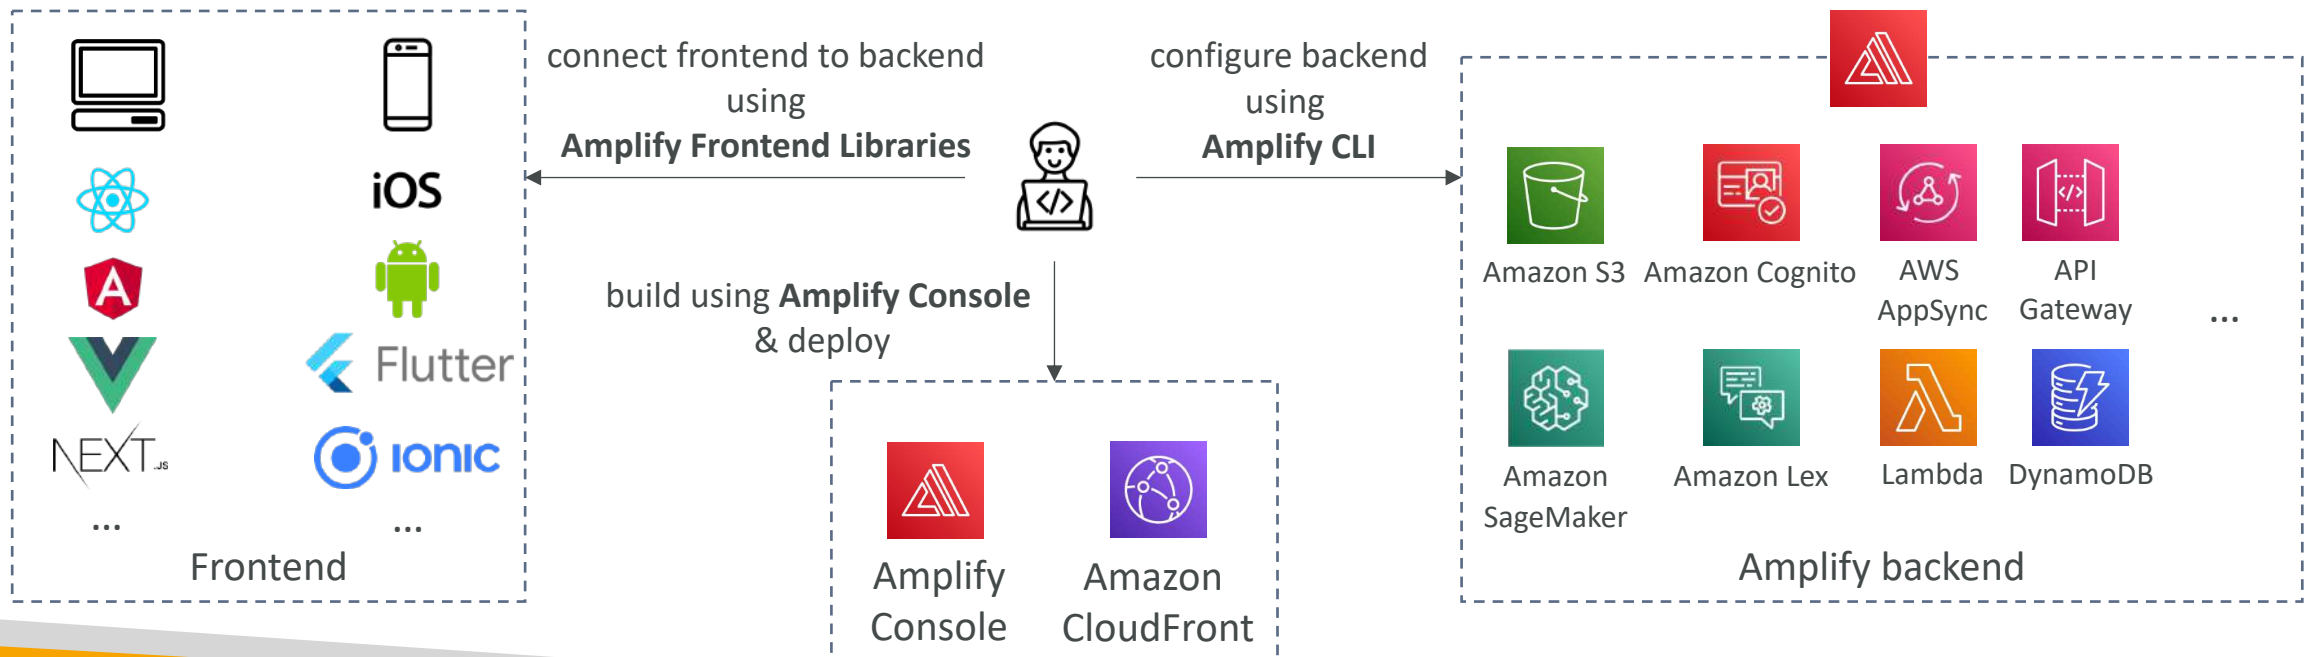

Exam Review & Tips

State of learning checkpoint

- Let's look how far we've gone on our learning journey

- https://aws.amazon.com/certification/certified-sysops-admin-associate/

AWS Certified SysOps Exam Labs

- Starting with SOA-C02, the exam will contain 3 labs

- Each exam lab consists of several different tasks

- AWS recommends to allocate 20 minutes for each exam lab

- First, you'll need to answer the multiple-choice/multiple-responses questions (you can't go back once you have completed this section)

- Second, you'll need to answer the exam labs

- You must complete all the work on the exam lab, before you move to the next one (you won't be able to go back to a lab once you have completed it)

AWS Certified SysOps Exam Sample Lab

- A company is deploying a new web application. Configure a highly available MySQL 8.0 database with the following:

1. Create a custom DB parametergroup and set theevent_schedulerparameter to trueand use thisparameter during DBinstance creation.

2. Create a custom AWS Key Management Service (AWS KMS) key and use this key during DBinstance creation.

3. Create a VPC security group that allows TCPport 3306 from the CIDR block 192.168.1.0/24.Use this security group during DB instance creation.

4. Launch the Amazon RDS DB instance.

5. After launch, take a manual RDS DB snapshot.
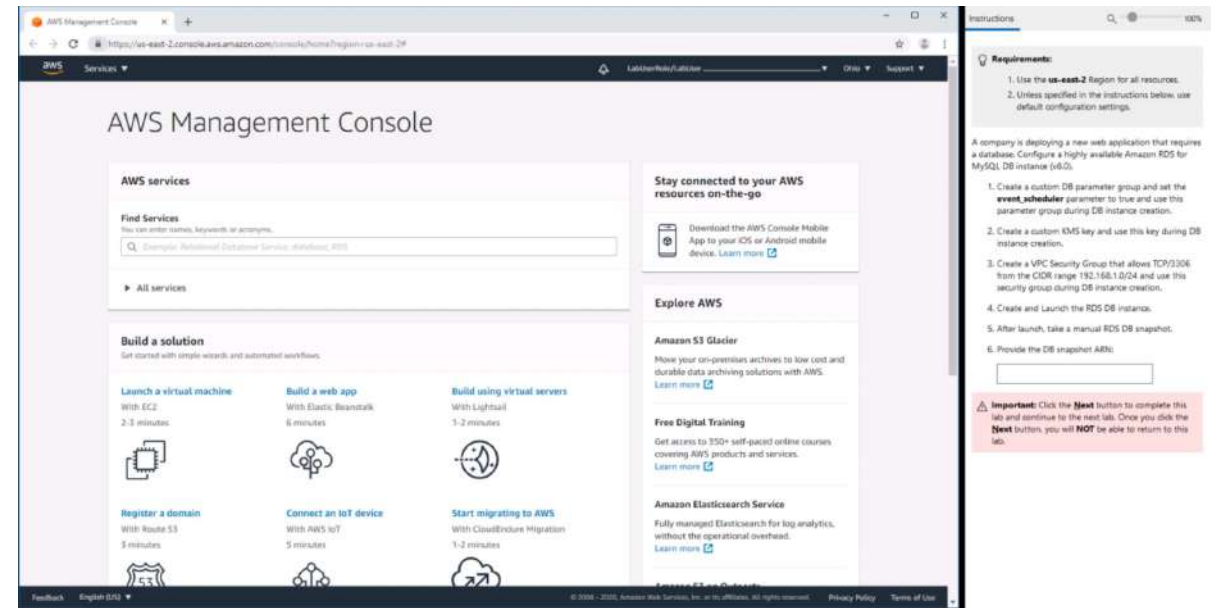

Your AWS Certification journey

Foundational

Knowledge-based certification for
foundational understanding of AWS Cloud.
No prior experience needed.

Associate

Role-based certifications that showcase your knowledge
and skills on AWS and build your credibility as an AWS Cloud professional.
Prior cloud and/or strong on-premises IT experience recommended.

Professional

Role-based certifications that validate advanced skills
and knowledge required to design secure, optimized,
and modernized applications and to automate processes on AWS.
2 years of prior AWS Cloud experience recommended.

Specialty

Dive deeper and position yourself as a trusted advisor to your
stakeholders and/or customers in these strategic areas.
Refer to the exam guides on the exam pages for recommended experience.

AWS Certification Paths – Architecture

Architecture
Solutions Architect
Design, develop, and manage cloud infrastructure and assets, work with DevOps to migrate applications to the cloud

optional for IT/ cloud professionals

recommended for IT/cloud professionals to leverage AI

Dive Deep

Architecture
Application Architect
Design significant aspects of application architecture including user interface, middleware, and infrastructure, and ensure enterprise-wide scalable, reliable, and manageable systems

optional for IT/ cloud professionals

recommended for IT/cloud professionals to leverage AI

Dive Deep

AWS Certification Paths – Operations

Operations
Systems Administrator
Install, upgrade, and maintain computer components and software, and integrate automation processes

optional for IT/
cloud professionals

Dive Deep

Operations
Cloud Engineer
Implement and operate an organization's networked computing infrastructure and Implement security systems to maintain data safety

optional for IT/
cloud professionals

Dive Deep

© Stephane Maarek

AWS Certification Paths – DevOps

DevOps
Test Engineer
Embed testing and quality best practices for software development from design to release, throughout the product life cycle

DevOps
Cloud DevOps Engineer
Design, deployment, and operations of large-scale global hybrid cloud computing environment, advocating for end-to-end automated CI/CD DevOps pipelines

DevOps
DevSecOps Engineer
Accelerate enterprise cloud adoption while enabling rapid and stable delivery of capabilities using CI/CD principles, methodologies, and technologies

aws certified **Cloud Practitioner** FOUNDATIONAL → aws certified **Developer** ASSOCIATE → aws certified **DevOps Engineer** PROFESSIONAL

optional for IT/cloud professionals

aws certified **Cloud Practitioner** FOUNDATIONAL → aws certified **Developer** ASSOCIATE

optional for IT/cloud professionals

aws certified **SysOps Administrator** ASSOCIATE aws certified **Machine Learning Engineer** ASSOCIATE aws certified **DevOps Engineer** PROFESSIONAL

Optional   recommended for IT/cloud professionals working on AI/ML projects   **Dive Deep**

aws certified **Cloud Practitioner** FOUNDATIONAL — aws certified **SysOps Administrator** ASSOCIATE — aws certified **Machine Learning Engineer** ASSOCIATE — aws certified **DevOps Engineer** PROFESSIONAL → aws certified **Security** SPECIALTY

AWS Certification Paths – Security

Security

Cloud Security Engineer

Design computer security architecture and develop detailed cyber security designs. Develop, execute, and track performance of security measures to protect information

optional for IT/ cloud professionals

recommended for IT/cloud professionals to secure AI/ML systems

Dive Deep

Security

Cloud Security Architect

Design and implement enterprise cloud solutions applying governance to identify, communicate, and minimize business and technical risks

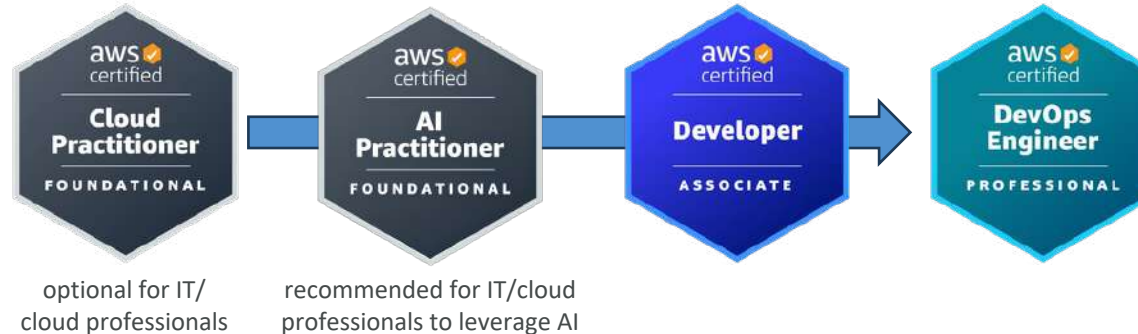

optional for IT/ cloud professionals

recommended for IT/cloud professionals to secure AI/ML systems

Dive Deep

AWS Certification Paths – Development & Networking

Development

Software Development Engineer

Develop, construct, and maintain software across platforms and devices

optional for IT/ cloud professionals

recommended for IT/cloud professionals to leverage AI

Networking

Network Engineer

Design and implement computer and information networks, such as local area networks (LAN), wide area networks (WAN), intranets, extranets, etc.

optional for IT/ cloud professionals

Dive Deep
AWS Certification Paths – Data Analytics & AI/ML

Data Analytics

Cloud Data Engineer

Automate collection and processing of structured/semi-structured data and monitor data pipeline performance

optional for IT/ cloud professionals

recommended for IT/cloud professionals working on AI/ML projects

Dive Deep

AI/ML

Machine Learning Engineer

Research, build, and design artificial intelligence (AI) systems to automate predictive models, and design machine learning systems, models, and schemes

optional for IT/ cloud professionals

optional for AI/ML professionals

Dive Deep

AWS Certification Paths – AI/ML

AI/ML
Prompt Engineer
Design, test, and refine text prompts to optimize the performance of AI language models

optional for IT/ cloud professionals

Dive Deep

AI/ML
Machine Learning Ops Engineer
Build and maintain AI and ML platforms and infrastructure. Design, implement, and operationally support AI/ML model activity and deployment infrastructure

optional for IT/ cloud professionals

optional for AI/ML professionals

AI/ML
Data Scientist
Develop and maintain AI/ML models to solve business problems. Train and fine tune models and evaluate their performance

optional for IT/ cloud professionals

optional for AI/ML professionals

Congratulations!

Congratulations!

- Congrats on finishing the course!
- I hope you will pass the exam without a hitch ☺

- If you haven't done so yet, I'd love a review from you!
- If you passed, I'll be more than happy to know I've helped
    - Post it in the Q&A to help & motivate other students. Share your tips!
    - Post it on LinkedIn and tag me!

- Overall, I hope you learned how to use AWS and that you will be a tremendously good AWS SysOps
